ABSTRACT

39

Carabao Mangoes are one of the sweetest mangoes in the world and one of the major producers of this is the Philippines. However, mangoes go through many screening processes, one of them being sorting and grading during post harvesting which is labor intensive, prone to human error, and can be inefficient if done manually. Previous researchers have taken steps to automate the process, however, their works often focus on only specific traits, and do not try to encapsulate all the physical traits of the mangoes altogether. Furthermore, previous researchers made the grading system static or unchangeable to the user. In this study, the researchers will develop an automated Carabao mango grader and sorter based on ripeness, size, and bruises with an interchangeable mango attribute priority through non-destructive means. Using machine vision, image processing, Machine Learning, microcontrollers and sensors the mangoes will be physically sorted into designated bins via a conveyor belt system which can be controlled and monitored via a graphical user interface. The approach will streamline the post-harvest process and cut down on human errors and labor costs, helping maintain the high quality of Carabao mango exports.

231 GLOSSARY

231	GLOSSARY	
232	accuracy score	A performance metric that measures the overall proportion of correct predictions made by a machine learning model.
233	bruises	The black or brown area of the mango that is visible on the skin of the mango.
234	Carabao mango	A popular variety of mango grown in the Philippines, known for its sweet and juicy flesh.
235	CNN	A type of deep neural network that is highly effective in analyzing and processing visual data, such as images.
236	computer vision	The use of cameras and algorithms to provide imaging-based inspection and analysis.
237	confusion matrix	A table that summarizes the performance of a classification model, showing the number of true positives, true negatives, false positives, and false negatives.
238	F1-Score	A balanced performance metric that is the harmonic mean of precision and recall, taking both into account.
239	machine learning	A subset of Artificial Intelligence that enables systems to learn and improve from data.
240	microcontroller	A small computing device that controls other parts of a system such as sensors.
241	Precision	A performance metric that reflects the percentage of instances classified as positive that are truly positive.
242	recall	A performance metric that measures the proportion of actual positive instances that the model correctly identified.

246

INTRODUCTION

247 **1.1 Background of the Study**

248 Mangoes, also known as the *Mangifera indica*, are a member of the cashew family. This
249 fruit can often be seen being farmed by countries such as Myanmar, the Philippines, and
250 India as they have a tropical dry season. Being in a tropical country is an important
251 aspect for mango cultivation as it ensures proper growth for mangoes. If aspects such as
temperature and rainfall are not ideal, it may affect the quality of the mango (?). Carabao

252 Fig. 1.1 Carabao Mangoes at Different Ripeness Stages (?)

253 mangoes is a variety of a mango that is found and cultivated in the Philippines. It is known
254 for its sweet signature taste that was recognized sweetest in the world in the Guinness
255 Book of World Records in 1995. The mango was named after the national animal of the
256 Philippines, a native breed of buffalo. On average, it is 12.5 cm in length and 8.5 cm in
257 diameter, having a bright yellow color when ripe as seen in Figure 1.1. It is often cultivated
258 during late May to early July (?).

259 As the Philippines is a tropical country, mangoes are a highly valued fruit as it is not
260 only the country's national fruit but also amongst the leading agricultural exports of the
261 country, ranking only third below bananas and pineapples. This gives the country the 9th
262 slot amongst the leading exporters of Mangoes across the world. Attributed to this ranking

De La Salle University

263 is the country's export of both fresh and dried mangoes, as well as low tariff rates. This
264 allows the country to export a large quantity of the fruit in countries such as Singapore,
265 Japan, and the USA as they can enter duty free markets provided by the World Trade
266 Organization and Japan. Due to this, the mangoes have become a major source of income
267 to an estimated 2.5 million farmers in the country (?).

268 Before mangoes are sold in markets, they first undergo multiple post-harvest processes.
269 This is to ensure that the mangoes that arrive in markets are utmost quality before being
270 sold to consumers. Moreover, it ensures that mangoes are contained and preserved properly
271 such that they do not incur damages and/or get spoiled on its transportation to the market.
272 Processing of the mango involves pre-cooling, cleaning, waxing, classification, grading,
273 ripening, packaging, preservation, storage, packing, and transportation (?) (?).

274 Among the processes that mangoes undergo, classification and grading is important as
275 it allows the manufacturer to separate mangoes with good qualities versus mangoes with
276 poor qualities. According to a study by (?), size, length, width, volume, density, indentation,
277 and grooves are aspects that determine the maturity of mangoes. These traits are being
278 checked along with the ripeness of the mango, sightings of bruise injury, and cracks on the
279 fruit (?) as these aspects affect the sellability of the fruit as well as the chances of it getting
280 spoiled sooner.

281 Previous studies have been made to automate the sortation process of the mangoes.
282 Among these is a research done by ?, which focuses on classification of mangoes using their
283 texture and shape features. They do this by, first, acquiring an image of the mango using
284 a digital camera. Then, these images are fed to the MaZda package, which is a software
285 originally developed for magnetic resonance imaging. Within the MaZda package is the
286 B11 program, which uses Principal Component Analysis, Linear Discriminant Analysis,

287 Nonlinear Discriminant Analysis, and texture classification to extract features from the
288 mango, which in this case are the length, width, and texture. This data is then compared to
289 a database in order to classify any given mango (?).

290 Another study is done by ?, which classifies mangoes based on their color, volume, size,
291 and shape. This is done by making use of Charge Coupled Devices, Complementary Metal-
292 Oxide Semiconductor sensors, and 3-layer Convolutional Neural Network. To classify the
293 mangoes, images are first captured and preprocessed to be used as a data set (?). This data
294 set is then augmented to be used as a model for the 3-layer Convolutional Neural Network.
295 After extracting the features of the mango, the 3-layer Convolutional Neural Network
296 is used as a method for their classification as it can mimic the human brain in pattern
297 recognition, and process data for decision making. This is important as some mangoes have
298 very subtle differences which make it difficult to differentiate them.

299 1.2 Prior Studies

300 A paper written by ?, designed an automated fruit sorting machine based on the quality
301 through an image acquisition system and CNN. Furthermore, the results of the paper show
302 that the image processing detection score was 89% while that of the tomatoes was 92%
303 while the CNN model had higher validity of 95% for mangoes and 93% for tomatoes.
304 15%, while the percentage of distinction between the two groups was reported to be 5%
305 respectively (?). Despite the high accuracy score in detecting mango defects, the fruit
306 sorting system only sorts based on the mango defects and not on ripeness, and weight.

307 Furthermore, the research paper presented by ? designed an Automated Carabao mango
308 classifier, in which the mango image database is used to extract the features like size, area

309 along with the ratio of the spots for grading using Naïve Bayes Model. For the results, the
310 Naïve Bayes' model recognized large and rejected mangoes with 95% accuracy and the
311 large and small/medium difference with a 7% error, suggesting an application for quality
312 differentiation and sorting in the mango business industry. Despite the high accuracy of
313 classifying Carabao mangoes, the researchers used a high quality DSLR camera for the
314 image acquisition system without any microcontroller to control the mangoes (?).

315 **1.3 Problem Statement**

316 As mangoes are among the top exports of the Philippines (?), assessing the physical
317 deformities is a necessity. The physical deformities of the Carabao mango can determine
318 the global competitiveness of the country. Having higher quality exports can often lead to
319 gaining competitive edge, increase in demand, increase export revenues, and becoming less
320 susceptible to low-wage competition (?). In order to increase the quality of mango fruit
321 exports, a key post-harvest process is done, which is sorting and grading. Mango sorting
322 and grading then becomes important to determine which batches are of high quality and can
323 be sold for a higher price, and which batches are of low quality and can only be sold for a
324 low price (?). Traditionally, fruit sorting and grading is inefficient as it is done manually by
325 hand. Some tools are used such as porous ruler to determine fruit size and color palette for
326 color grading (?). However, among the problems encountered in the process of manually
327 sorting and grading mangoes are susceptibility to human error and requiring a number of
328 laborers to do the task.

329 With the current advancements in technology, some researchers have already taken steps
330 to automate the process of sorting and grading mangoes. However, these attempts would

331 often only consider some of the aspects pertaining to size, ripeness, and bruises but not all
332 of them at the same time. Lastly, not all research approaches were able to implement a
333 hardware for their algorithm, limiting their output to only a software implementation and not
334 an embedded system. As such the proposed system would assess the export quality of the
335 Carabao mango based on all the mentioned mango traits, namely size, bruises, and ripeness
336 while also taking into consideration being non-destructive. These aspects are important
337 because, as was previously mentioned, there is a need to develop a Carabao mango sorter
338 that takes into account all these aspects at the same time while being non-destructive.

339 **1.4 Objectives and Deliverables**

340 **1.4.1 General Objective (GO)**

- 341 • GO: To develop a user-priority-based grading and sorting system for Carabao man-
342 goes, using machine learning and computer vision techniques to assess ripeness, size,
343 and bruises. ;

344 **1.4.2 Specific Objectives (SOs)**

- 345 • SO1: To make an image acquisition system with a conveyor belt for automatic sorting
346 and grading mangoes. ;
- 347 • SO2: To get the precision, recall, F1 score, confusion matrix, and train and test
348 accuracy metrics for classifying the ripeness and bruises with an accuracy score of at
349 least 90%;

- 350 • SO3: To create a microcontroller-based system to operate the image acquisition
351 system, control the conveyor belt, and process the mango images through machine
352 learning. ;
- 353 • SO4: To grade mangoes based on user priorities for size, ripeness, and bruises. ;
- 354 • SO5: To classify mango ripeness based on image data using machine learning
355 algorithms such as kNN, k-mean, and Naïve Bayes. ;
- 356 • SO6: To classify mango size based on image data by getting its length and width
357 using OpenCV, geometry, and image processing techniques. ;
- 358 • SO7: To classify mango bruises based on image data by employing machine learning
359 algorithms.

360 **1.4.3 Expected Deliverables**

361 Table 1.1 shows the outputs, products, results, achievements, gains, realizations, and/or
362 yields of the Thesis.

TABLE 1.1 EXPECTED DELIVERABLES PER OBJECTIVE

Objectives	Expected Deliverables
GO: To develop a user-priority-based grading and sorting system for Carabao mangoes, using machine learning and computer vision techniques to assess ripeness, size, and bruises.	<ul style="list-style-type: none"> • To develop a Carabao mango grading and sorting system. • To grade Carabao mangoes into three categories based on ripeness, size, and bruises using machine learning. • To integrate sensors and actuators to control the conveyor belt and image acquisition system.

Continued on next page

TABLE 1.1 EXPECTED DELIVERABLES PER OBJECTIVE

Objectives	Expected Deliverables
SO1: To make an image acquisition system with a conveyor belt for automatic sorting and grading mangoes.	<ul style="list-style-type: none"> To make an image acquisition system with a camera and LED light source. To build a flat belt conveyor for moving the mangoes.
SO2: To get the precision, recall, F1 score, confusion matrix, and train and test accuracy metrics for classifying the ripeness and bruises with an accuracy score of at least 90%.	<ul style="list-style-type: none"> To use a publicly available dataset of at least 10,000 mango images for classification of ripeness and bruises.
SO3: To create a microcontroller-based system to operate the image acquisition system, control the conveyor belt, and process the mango images through machine learning.	<ul style="list-style-type: none"> To develop an intuitive UI where users can start and stop the system. To implement a priority-based grading system with sliders for ripeness, bruises, and size.
SO4: To grade mangoes based on user priorities for size, ripeness, and bruises.	<ul style="list-style-type: none"> To utilize a linear combination formula as the overall mango score, where each classification level contributes a grade, weighted by the priority assigned to the three properties. To assign score values for each classification level of the mango.
SO5: To classify mango ripeness based on image data using machine learning algorithms such as kNN, k-mean, and Naïve Bayes.	<ul style="list-style-type: none"> To train a machine learning model such as kNN, k-means, or Naïve Bayes capable of classifying mango ripeness based on the image color. To gather a dataset of annotated images with ripeness labels. To obtain an evaluation report of performance metrics of the model.
SO6: To classify mango size based on image data by getting its length and width using OpenCV, geometry, and image processing techniques.	<ul style="list-style-type: none"> To develop an image processing algorithm capable of determining mango size using OpenCV, NumPy, and imutils. To classify mangoes based on size into small, medium, and large based on measurements.

TABLE 1.1 EXPECTED DELIVERABLES PER OBJECTIVE

Objectives	Expected Deliverables
SO7: To classify mango bruises based on image data by employing machine learning algorithms.	<ul style="list-style-type: none"> • To train a machine learning model such as CNN capable of distinguishing bruised and non-bruised mangoes. • To train a machine learning model such as kNN, k-means, and Naïve Bayes capable of assessing the extent of bruising on the mangoes if it is significant or partial. • To gather a dataset of annotated images based on bruises. • To obtain an evaluation report of performance metrics of both CNN and other machine learning models.

1.5 Significance of the Study

Automating the process of sorting and grading mangoes increases efficiency and productivity for the user which would in effect remove human error in sorting and grading and decrease the human labor and time taken to sort and grade the mangoes. This is especially important for farmers with a large amount of fruit such as mangoes and a lesser labor force. A recent study showed that their automated citrus sorter and grader using computer vision can reduce the human labor cost and time to sort and grade when comparing the automated citrus sorter and grader to manual human labor ?.

Another benefit to automating sorting and grading mangoes is the improvement in quality control. This implies that compared to human labor, automating sorting and grading mangoes can uniformly assess the quality of mangoes based on size, color, and bruises, ensuring that the expected grade and high-quality mangoes reach the consumer. By accurately identifying substandard mangoes, the system helps in reducing waste and

De La Salle University

376 ensuring that only marketable fruits are processed further.

377 Likewise, the scalability of automating sorting and grading mangoes is simpler, es-
378 pecially for lower labor force farmers with large volumes of mangoes. Because of the
379 possibility of large-scale operations by automating sorting and grading mangoes, farmers
380 can now handle large volumes of mangoes, making them suitable for commercial farms
381 and processing plants. Moreover, it can be adapted to different varieties of mangoes and
382 potentially other fruits with minor modifications.

383 **1.5.1 Technical Benefit**

- 384 1. The development of an automated Carabao mango sorter would increase the quality
385 control of classifying Carabao mango based on ripeness, size, and bruising.
- 386 2. The accuracy in sorting Carabao mangoes will be significantly improved while
387 reducing the errors due to human factors in manual sorting.
- 388 3. The automated Carabao mango sorter carefully sorts the mangoes while ensuring
389 that they remain free from bruising or further damage during the process

390 **1.5.2 Social Impact**

- 391 1. The reduction in manual labor creates opportunities in maintenance and technologies
392 in the automated Carabao mango sorter.
- 393 2. The automated Carabao mango sorter system improves Carabao mango standards
394 and enhances the satisfaction of the buyers and the customers through guaranteeing
395 consistent Carabao mango grade.

- 396 3. Opportunity to increase sales and profit for the farmers through consistent quality
397 and grade Carabao mangoes while reducing the physical labor to sort it.

398 **1.5.3 Environmental Welfare**

- 399 1. With the utilization of non-destruction methods of classifying Carabao mangoes
400 together with an accurate sorting system, overall waste from Carabao mangoes is
401 reduced and the likelihood of improperly sorted mangoes is decreased.
402 2. Automation of sorting and grading Carabao mangoes promotes sustainable farming
403 practices.

404 **1.6 Assumptions, Scope, and Delimitations**

405 **1.6.1 Assumptions**

- 406 1. The Carabao mangoes are from the same source together with the same variation
407 2. The Carabao mangoes do not have any fruit borer and diseases
408 3. All the components do not have any form of defects
409 4. The prototype would have access to constant electricity/power source.
410 5. The Carabao mangoes to be tested would be in the post-harvesting stage and in the
411 grading stage.
412 6. The image-capturing system would only capture the two sides of the mango which
413 are the two largest surface areas of the skin.

414 **1.6.2 Scope**

- 415 1. The prototype would be specifically designed to grade and sort Carabao Mangoes
416 based on only ripeness, size, and visible skin bruises.
- 417 2. The mangoes used as the subject will be solely sourced from markets in the Philip-
418 pines.
- 419 3. The Carabao mangoes would be graded into three levels.
- 420 4. The prototype will be using a microcontroller-based system locally stored on the
421 device itself to handle user interaction.
- 422 5. Computer vision algorithms to be used will include image classification.

423 **1.6.3 Delimitations**

- 424 1. The project would only be able to perform sorting and grading on one specific fruit
425 which is the Carabao mango and will not be able to sort other types of mangoes.
- 426 2. Additionally, the project prototype will only be able to capture, sort, and grade one
427 mango subject at a time which means the mangoes have to be placed in the conveyor
428 belt in a single file line for accurate sorting.
- 429 3. For the bruises, the system will only be able to detect external bruises and may not
430 identify the non-visible and internal bruises.
- 431 4. The system does not load the mangoes onto the conveyor belt itself. Assistance is
432 required to put mangoes into the conveyor belt to start the sorting process

- 433 5. The prototype will be powered using Alternating Current (AC) power and will be
 434 plugged into a wall socket which is only suitable for indoor use.

435 **1.7 Estimated Work Schedule and Budget**

TASKS	THSCP4A				THSCP4B				THSCP4C			
	Week 1-3	Week 4-6	Week 7-9	Week 10-13	Week 1-3	Week 4-6	Week 7-9	Week 10-13	Week 1-3	Week 4-6	Week 7-9	Week 10-13
Topic Proposal and Defense	BANAL, BAUTISTA, HERMOSURA, SALAZAR				HERMOSURA AND SALAZAR							
Buying and Collecting of Materials												
Training and Testing the CNN model					BANAL AND BAUTISTA							
Integrating the sensors and actuators to the Arduino Uno						HERMOSURA AND SALAZAR						
Coding of the Application with CNN model to the Raspberry Pi and connecting it to the Arduino Uno						BANAL AND BAUTISTA						
Polishing and Revising the UI App						BANAL AND BAUTISTA						
Testing and Surveying of the System with the Carabao Mangoes						BANAL, BAUTISTA, HERMOSURA, SALAZAR						
Data Gathering									BANAL, BAUTISTA, HERMOSURA, SALAZAR			

Fig. 1.2 Gantt Chart

436 As seen above, Table 1.2 shows the Gantt Chart together with the assigned task. For
 437 the first part of the THSCP4A, the group would primarily revise and fine tune Chapters
 438 1 and 2 while also preparing for the defense. After that for THSCP4B, the yellow team
 439 which consists of two members, Hermosura and Salazar, would start buying and collecting
 440 the materials needed for assembling the prototype. While team yellow is doing that,
 441 team purple which consists of Banal and Baustista would start training and validating the
 442 Convolution Neural Network (cnn) model based on the Carabao mango image dataset.
 443 After that integration of the sensors and actuators together with the integration of the cnn
 444 model and beginning of coding of the Application to the Raspberry Pi would be done. Once
 445 that cnn model is deployed and the Application works testing of the Carabao mangoes to
 446 the prototype would be done. During THSCP4C, data gathering would be done together
 447 with polishing and revising of the final paper.

448 **1.8 Overview of the Thesis**

449 There are seven succeeding chapters. To recall, chapter 1 involves the introduction of
450 the thesis topic containing the background of the study, previous studies, objectives and
451 deliverables, assumptions, scope, and delimitation, significance of the study, description
452 of the project together with the methodology, and Gantt chart and budget. Chapter 2
453 involves the existing articles, the lacking in their approaches, and the summary of chapter 2.
454 Chapter 3 involves the theoretical considerations of the thesis topic while chapter 4 would
455 consist of the design consideration involving the thesis topic. Chapter 5 would involve the
456 research methodology containing the testing procedure and setup. Chapter 6 would involve
457 the results and discussion based on the methodology while Chapter 7 would involve the
458 conclusion, recommendations, and future suggestions.

459

Chapter 2

460

LITERATURE REVIEW

461 **2.1 Existing Work**

462 The research paper written by ? developed a ripeness grader for Carabao mangoes. The
463 Carabao mango ripeness grade calculated based on object and color detection which were
464 written in microcontroller. These are the systems designed by the researchers that consists
465 of Raspberry Pi 4, Arduino Uno, camera, touch screen LCD, MQ3 gas sensor, ventilation
466 system. The proposed system was able to ascertain an overall reliability of 95%: therefore,
467 the specified objective of ascertaining the ripeness level of the mangoes was met with
468 success. However, accuracy and reliability of the software system are there since the
469 hardware design does not seem to be workable when one must deal with the scores of
470 mangoes (?). In addition, the design of the hardware does not integrate any form of physical
471 automating, say like the conveyor belt. Besides, the hardware system only works efficiently
472 when deciding the ripeness grade of mangoes separately.

473 A study done by ? is another research paper that supports and has relevant information
474 concerning the topic. The researchers proposed a fully-perovskite photonic system which
475 has the capability to identify and sort or grade mango based on features such as color,
476 weight and, conversely, signs of damages (?). Some of the techniques in image processing
477 that the researchers used included image enhancement, image deblurring, edge detection
478 using MATLAB and Arduino as well as color image segmentation. By carrying out the
479 multiple trials on the device they achieved a classification speed of 8.132 seconds and an
480 accuracy of 91.2%. The proponents' metrics used for the ratings were speed wherein the
481 results were rated “excellent” while the accuracy rating given was “good”. One of the
482 limitations of the paper is that the researchers were only limited to the color, texture, and
483 size of the Carabao mango

484 Furthermore, the research paper presented by ? designed an Automated Carabao
485 mango classifier, in which the mango image database is used to extract the features like
486 weight, size, area along with the ratio of the spots for grading using Naïve Bayes Model.
487 Concerning the quantitative test design, one had to control and experiment with various
488 methods of image processing that would improve the likelihood of improved classification.
489 The paper methodology entailed sample collection from 300 Carabao mangoes, picture
490 taking using a DSLR camera, and feature deconstruction for categorization (?). The
491 system prototype and the software were designed with the programming language C# with
492 integration of Aforge. NET routines. The performance of this model was checked with
493 the help of the dataset containing 250 images, precision, recall, F-score key indicators
494 were used. The investigation discovered that the Naïve Bayes' model recognized large and
495 rejected mangoes with 95% accuracy and the large and small/medium difference with a
496 7% error, suggesting an application for quality differentiation and sorting in the mango
497 business industry. The limitations in the researchers' paper include the researchers were
498 able to achieve high accuracy after using a high quality DSLR camera and the fact that the
499 researchers were not able to incorporate the use of microcontrollers.

500 Another study by ? proposed SVM-based system for classifying the maturity stages of
501 bananas, mangoes, and calamansi. With the use of 1729 images of bananas together with
502 711 mango images and 589 calamansi, the researchers were able to achieve a high accuracy
503 score of above 90% for all fruits. Some pre-processing techniques used to get this high
504 accuracy are the change in hue, saturation, and value channels in the mango image (?). To
505 better understand the harvest time of mangoes, the paper by ? examined the association of
506 the harvest season with seasonal heat units, rainfall, and physical fruit attributes for Haden,
507 Kent, Palmer, and Keitt mango varieties to establish export and domestic market maturity

De La Salle University

508 standards. For the results of the paper, it shows that temperature, rainfall, and physical
 509 characteristics have a reliable, non-destructive indicators for determining mango maturity
 510 (?). This shows that physical characteristics and temperature are important when exporting
 511 fruits such as mangoes.

TABLE 2.1 COMPARISON OF EXISTING STUDIES

Existing Study	Limitations	Accuracy Rating
?	No physical automation, not suitable for large amounts of mangoes, only classifies ripeness and only a sample size of 10 mangoes.	95%
?	Focuses only on color and size.	91.2%
?	Relies on high-quality DSLR cameras, and limited automation due to not integrating microcontrollers.	95%
?	No physical automation implemented. Ripeness, size, and shape-based classification achieved 100%, 98.19%, and 99.20% accuracy respectively on their own. However, errors occurred when taking into account all these aspects together for grading mangoes, causing an accuracy rating deduction.	88.88%

512 Previous studies on mango grading have achieved an accuracy rating of up to 95%, as
 513 shown in Table 2.1. However, these studies either relied on a small sample size, which
 514 limits statistical significance, or utilized expensive equipment, which may be impractical.
 515 In light of this, the researchers have set a target accuracy rating of greater than or equal
 516 to 90%. This target ensures that the system being developed is comparable to, or better
 517 than, existing studies that used larger sample sizes or assessed multiple mango traits at the
 518 same time. Furthermore, this research aims to distinguish itself by not only maintaining or
 519 exceeding the 90% accuracy rating but also incorporating a graphical user interface (GUI)

520 for selective priority-based mango classification. The system will integrate both software
521 and hardware components, and it will evaluate a greater number of mango traits for grading
522 purposes.

523 **2.1.1 Sorting Algorithms**

524 In previous studies, researchers have implemented various artificial intelligence algorithms
525 in order to determine the optimal and most effective method for sorting mangoes. One of
526 the algorithms that was used in the classification of mangoes was the CNN or Convolutional
527 Neural Networks. A study done by ? explored the effectiveness of CNN, specifically in
528 classifying mangoes through image processing. The system that the researchers developed
529 graded mangoes into four groups which was based on the Chinese National Standard (?).
530 These mangoes were examined by their shape, color uniformity, and external defects. The
531 system that was developed had an impressive accuracy of 97.37% in correctly classifying
532 the mangoes into these grading categories Support Vector Machine was also one of the
533 classification algorithms that was implemented to detect flaws in mangoes. In that study by
534 ?, SVM was used in the classification of diseases from mangoes. The study used 4 different
535 diseases/defects for testing (?). The diseases were Anthracnose, Powdery Mildew, Black
536 Banded, and Red Rust. and provided 90% accuracy for both the leaves and the fruit

537 In the study done by ?, Simple Linear Regression, Multiple Linear Regression, and
538 Artificial Neural Network models were all studied and compared for the purpose of size-
539 mass estimation for mango fruits. The researchers found that the Artificial Neural Network
540 yielded a high accuracy rating for mass estimation and for mango classification based on
541 size with a success rate of 96.7% (?). This is attributed to the Artificial Neural Network
542 model's ability to learn both linear and nonlinear relationships between the inputs and the

543 outputs. However, a problem can occur with the use of the model, which is overfitting.
544 This issue occurs when the model is overtrained with the data set such that it will start to
545 recognize unnecessary details such as image noise which results in poor generalization
546 when fed with new data. With this in mind, additional steps will be necessary to mitigate the
547 issue. Another research article written by ? implements a method for sorting and grading
548 Carabao mangoes. This research focuses on the use of Probabilistic Neural Network, which
549 is another algorithm that is used for pattern recognition and classification of objects. For
550 this study, the researchers focused on the area, color, and the black spots of the mango
551 for their Probabilistic Neural Network model (?). Their research using the model yielded
552 an accuracy rating of 87.5% for classification of the mangoes which means it is quite
553 accurate for classifying mangoes within the predefined categories. However, problems
554 were encountered with the use of the model when trying to identify mangoes that did not
555 fit the predefined size categories of small, medium, and large. This means that the PNN
556 model may become challenged when presented with a mango with outlying traits or traits
557 that were very different from the data set.

558 2.2 Lacking in the Approaches

559 The majority of past researchers such as ? and ? were able to implement a fruit and
560 mango sorter together with an accurate AI algorithm to detect the ripeness defects. This
561 means that none of the previous research papers were able to integrate an interchangeable
562 user-priority-based grading together with size, ripeness, and bruises using machine learning
563 for Carabao mango sorter and grader. Our research however would implement an automated
564 Carabao mango sorter in terms of size, ripeness, and bruises with its own UI, conveyor

TABLE 2.2 COMPARISON OF SORTING ALGORITHM MODELS

Sorting Algorithm Model	Accuracy Rating	Criteria	Problems Encountered
Convolution Neural Network	97.37%	shape, color, defects	Minor blemishes affected the accuracy.
Support Vector Machine	90%	mango defects and diseases	The model is sensitive to noise, which requires intensive image preprocessing.
Artificial Neural Network	96.7%	for mango size and mass	Overfitting
Probabilistic Neural Network	87.5%	for mango area, color, and black spots	Difficulty in identifying mangoes that have outlying features or did not fit the predefined categories

565 belt, stepper motors, and bins for collecting the different ripeness and defect grade of the
 566 Carabao mango.

2.3 Summary

568 To reiterate, there is an innovative gap that needs to be filled with regards to the process of
 569 sorting and grading Carabao mangoes. The traditional methods for conducting this process
 570 manually by hand, by a porous ruler, by a sugar meter, and by a color palette can be prone
 571 to human error and expensive costs due to the number of laborers required to do the task.
 572 On the other hand, although researchers have already taken steps to automate the process
 573 of mango sorting and grading, there is still a need for an implementation that takes into
 574 account size, ripeness, and bruises altogether whilst being non-destructive and having its
 575 own embedded system. The research articles shown above show the different computer

De La Salle University

576 vision and CNN approaches for sorting and classifying mangoes. For example, a system
577 created by ? was more focused on ripeness detection. ? considered photonic systems
578 for grading mango fruit based on color and weight. On the other hand, ? implemented
579 the Naïve Bayes classification model on mangoes with high accuracy, which thereby did
580 not include any microcontroller. There was an attempt to study each of those parameters
581 separately and that is why the multifactorial approach was not used. With this in mind, the
582 system being proposed does exactly what was mentioned, to implement a non-destructive
583 and automated sorting and grading system for Carabao mangoes that takes into account
584 size, ripeness, and bruises altogether using machine learning, as well as having its own
585 embedded system. This system will be mainly composed of a conveyor belt, servo motors,
586 a camera, microcontrollers, and an LCD display for the user interface. By doing so, the
587 system should be able to improve the efficiency and productivity of mango sorting and
588 grading, remove the effect of human error and reduce time consumption. The studies also
589 provided critical insights regarding the effective algorithms that can be used in classification
590 stages in image processing. The use of CNN had the most accuracy with manageable
591 potential challenges. Lastly, by scaling the implementation, the overall export quality of
592 the Carabao mangoes can be improved.

593

Chapter 3

594

THEORETICAL CONSIDERATIONS

595 3.1 Introduction

596 Likewise, the purpose of this chapter is to go through the important theories in developing
 597 the prototype together with training and testing the machine learning model.

598 3.2 Relevant Theories and Models

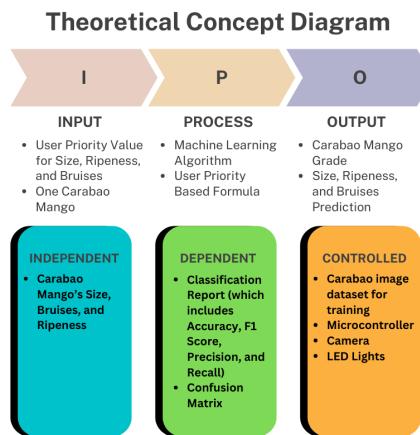

Fig. 3.1 Theoretical Framework Diagram.

599 The theoretical framework seen in figure 3.1 follows the IPO (Input-Process-Output)
 600 Model for a Carabao Mango Sorting System. The Input section includes user-defined
 601 priority values for size, ripeness, and bruises, along with a single mango for analysis. The
 602 Process section highlights the use of a machine learning algorithm and a user-priority-based
 603 formula to classify the mango. The Output consists of the mango's grade, predicted size,
 604 ripeness, and bruises. Below the IPO model, the diagram categorizes variables into three
 605 groups: Independent (mango's size, ripeness, and bruises), Dependent (classification report
 606 with accuracy, precision, recall, and confusion matrix), and Controlled (image dataset,
 607 microcontroller, camera, and LED lights).

3.3 Technical Background

At its core, the system will be using machine learning concepts pertaining to CNN and OpenCV, and may use other algorithms such as Naive Bayes and k-Nearest Neighbors to supplement the classification tasks, particularly for assessing mango ripeness, bruise detection, and size determination. The system will be built on an embedded framework, integrating a Raspberry Pi microcontroller to control the RaspberryPi camera, actuators, LED lights, and motors. A user-friendly GUI will also be utilized to ensure users can customize the prioritization of the mango sorting system.

3.4 Conceptual Framework Background

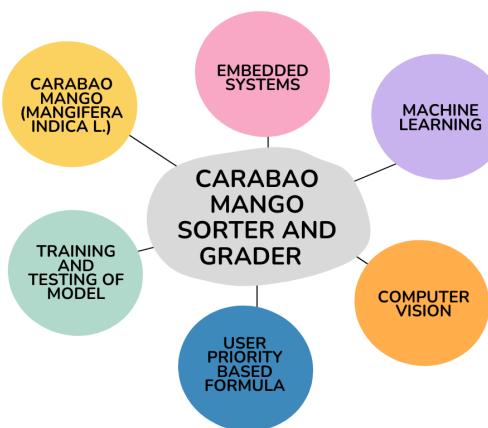

Fig. 3.2 Conceptual Framework Diagram.

The conceptual framework seen in figure 3.2 illustrates the key components involved in the Carabao Mango Sorter and Grader system. At the center, the system is represented as the core element, surrounded by six interconnected components: Carabao Mango (Mangifera indica L.), Embedded Systems, Machine Learning, Computer Vision, User

621 Priority-Based Formula, and Training and Testing of the Model. These elements represent
622 the different technologies, methodologies, and considerations required for the development
623 and operation of the sorter and grader. The diagram provides an overview of how various
624 disciplines contribute to the project's functionality.

625 **3.5 Software Concepts**

626 **3.5.1 Thresholding**

627 Thresholding is a computer vision image segmentation technique that is used to separate
628 objects from their surroundings by converting a grayscale image to binary. The conversion
629 is done by choosing a certain threshold intensity value. It is usually done by assigning pixels
630 with an intensity higher than the threshold are mapped to one value (commonly white),
631 and pixels with an intensity lower than the threshold are mapped to another (commonly
632 black). The result of this technique is in a high-contrast image that makes it easy to detect
633 the object's boundary and shape in the image.

634

635 In this project, two types of thresholding were applied:

- 636 • Absolute Difference Thresholding – This method involves computing the absolute
637 difference between two images. The first image is one of the object, and the other
638 of the same background without the object. The result isolates only the pixels that
639 have changed between the two images, thus isolating the mango from its background
640 successfully.
- 641 • Binary Thresholding – Once the difference image has been created, binary threshold-

642 ing is used. A threshold value is employed to threshold the difference image into a
 643 binary image. Values greater than the threshold are made white (foreground), and
 644 values less than that are made black (background). This creates a clear silhouette of
 645 the mango, which is appropriate for size estimation and contour detection.

646 **3.5.2 Object Size Calculation**

647 Object size calculation is the calculation of a certain object's true size from image data. This
 648 is essential in computer vision systems to efficiently process object features in real-time.
 649 In this research, the size of the Carabao mango is estimated through image measurement
 650 techniques based on geometric principles and camera calibration.

651 The size of the mango can be determined given:

$$\text{Real World Dimension} = \frac{\text{Pixel Dimension} \times \text{Distance from Camera to Object}}{\text{Focal Length}} \quad (3.1)$$

$$D(p, d, f) = \frac{p \cdot d}{f} \quad (3.2)$$

652 where $D(p, d, f)$ is the real world dimension of the object, p is the pixel dimension of
 653 the object, d is the distance from the camera to the object, and f is the focal length of the
 654 camera.

655 After capture and preprocessing of the image, the binary image so obtained is processed
 656 with contour detection to find the largest object, which is assumed to be the mango. The
 657 contour is then bounded with a minimum-area bounding box, and pixel-based length and
 658 width are calculated using Euclidean distance between the corner points.

659 This size estimation method offers a consistent and efficient way of taking the mea-
660 surements with only standard camera input, providing consistency in classification and
661 reducing the necessity for physical measuring devices.

662 **3.5.3 Convolutional Neural Network**

663 Convolutional Neural Networks are a class of deep learning models is commonly used in
664 analyzing visual data. CNNs are particularly effective in image classification tasks due to
665 their ability to automatically extract and effectively learn the spatial hierarchies of features
666 directly from the pixels of a given image. This makes it highly suitable for functions such
667 as object detection and, in the case of this study, image classification.

668 CNN usually applies filters to input images. These filters are designed to detect local
669 patterns such as edges, textures, and color gradients. The network is able to learn more
670 patterns as the data goes through the layers. This enables it to recognize effectively the
671 characteristics that it is looking for.

672 The use of CNNs in this study allows for accurate, automated classification of mango
673 images which contributes to the development of a reliable, non-destructive grading system
674 that minimizes human error and ensures consistent quality assessment

675 **3.6 Hardware Concepts**

676 **3.6.1 Camera Module**

677 The camera module serves as the main image acquisition tool in the mango sorter and
678 grader system. Its role is to capture clear, high-resolution images of each mango as it moves

679 along the conveyor. These images are critical for analyzing physical traits like ripeness,
680 bruising, and size through computer vision and machine learning techniques.

681 The camera is directly connected to the Raspberry Pi, which manages both image
682 capture and processing. It is fixed in position to ensure consistent distance and angle for
683 all images. It is also paired with a lighting system to provide a consistent lighting for the
684 images. The system captures images of both the top and bottom sides of each mango to
685 ensure a more accurate grading. The prototype integrates the Raspberry Pi Camera Module
686 Version 2. This camera is chosen for its 8MP resolution which is critical in capturing
687 real-time images. Another reason for integrating this camera is because of its compatibility
688 with the Raspberry Pi 4, and reliability in capturing detailed images needed for accurate
689 classification. It is also cost effective and lightweight which is important for the prototype.

690 **3.6.2 4 Channel Relay**

691 The relay module in this project is used to control the direction and movement of the
692 motors that operate the conveyor system and mango sorting mechanism. As an electrically
693 operated switch, the relay allows the low-power signals from the Raspberry Pi to safely
694 manage the higher voltage and current required by the DC motors.

695 For the prototype, the relay module is responsible for changing the polarity of motor
696 connections which enables the motors to rotate in both forward and reverse directions.
697 This will drive the conveyor belt system. This is essential for moving mangoes along the
698 conveyor, rotating them for the top and bottom image capture, and directing them to the
699 appropriate bin based on their grade.

700 **3.6.3 Gear Ratio**

701 In this prototype, gear ratios are used to control the rotational speed of the conveyor belts
702 that move and rotate the mango. A gear ratio of 1:3 was applied, meaning the motor gear
703 completes one full rotation for every three rotations of the driven gear. This is also done in
704 order to avoid overspeeding and make sure that the conveyor belt moves in a controlled
705 manner. This setup slows down one belt relative to the other, creating a differential speed
706 between the left and right belts. As a result, the mango rotates in place while being moved
707 forward. This rotation is essential for capturing both the top and bottom views of the mango
708 for accurate classification and grading.

709 **3.7 Summary**

710 Overall, chapter 3 establishes key concepts and theoretical considerations that form the
711 foundation of the Carabao mango sorter and grading system. It discusses and connects
712 each component together, explaining how each component such as the RaspberryPi and
713 DC motors work together to create a system that utilizes machine learning and computer
714 vision techniques to classify mangoes based on user priority.

715

Chapter 4

716

DESIGN CONSIDERATIONS

717 Likewise, the objective of chapter 4 is to describe the researcher's design consideration
718 when developing and testing the prototype. For an overview of the design of the prototype,
719 the researchers considered different computer vision models in classifying the ripeness
720 and bruises together with other algorithms to determine the size of the mango. Likewise,
721 the hardware design was also taken into consideration where the physical design of the
722 conveyor belt was taken into account.

723 **4.1 Introduction**

724 This chapter discusses the design considerations for the mango sorting and grading system,
725 focusing on the technical and engineering decisions required for its development. The
726 design process aims to create a scalable, efficient, and user-friendly system that leverages
727 machine learning for accurate mango classification.

728 **4.2 System Architecture**

729 The system architecture is represented through a block diagram, showcasing modules
730 such as image acquisition, preprocessing, feature extraction, machine learning model, and
731 grading output. Each module is described in detail, emphasizing its role in the overall
732 system. For instance, the image acquisition module uses high-resolution cameras to capture
733 mango images, while the preprocessing module enhances image quality for better feature
734 extraction.

735 In figure 4.1 presents the electronic circuit diagram, designed using Proteus. The
736 diagram illustrates a system where a Raspberry Pi 4 serves as the central control unit,

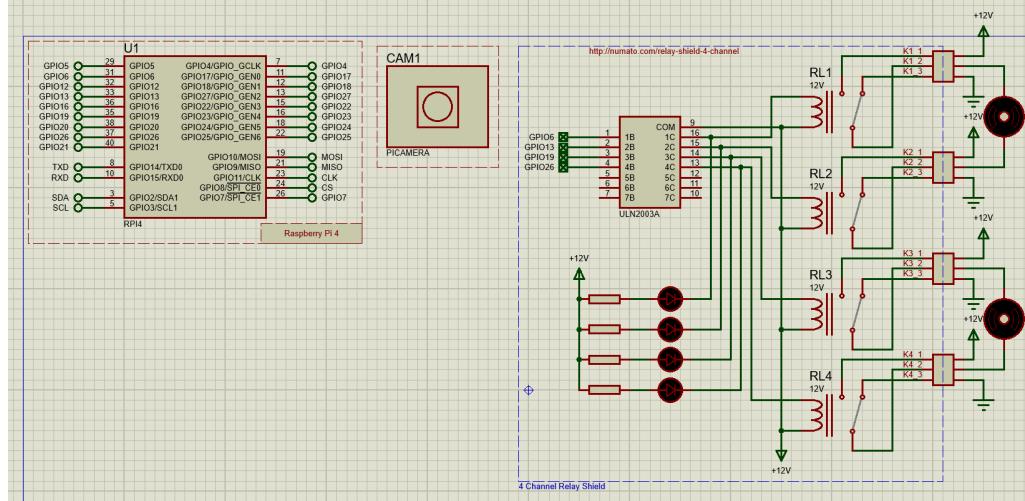

Fig. 4.1 Hardware Schematic

737 managing four motors through a relay mechanism. The Raspberry Pi 4, represented by
 738 a rectangular box on the left, showcases various pin connections, including GPIO pins,
 739 power supply pins (5V and 3V3), ground pins (GND), and communication pins (TXD,
 740 RXD, SDA, SCL).

741 In the center of the diagram, an 18-pin integrated circuit labeled "ULN2803A" is
 742 depicted. This component, a Darlington transistor array, likely functions as a buffer,
 743 providing the necessary current to drive the relays. Four relays, designated as RL1, RL2,
 744 RL3, and RL4, are positioned on the right side of the diagram, each connected to a motor
 745 (represented by a circle with an "M" inside) and a +12V power source. Additionally, four
 746 resistors are placed between the ULN2803A and the relays, serving to limit current. The
 747 circuit section containing these resistors is labeled "4 Channel Relay Driver," indicating its
 748 purpose.

749 The camera module is labeled "PICAMERA" is located in the top center of the diagram.
 750 It is represented by a square with a circle inside, symbolizing the camera lens. The camera

751 module is connected to the Raspberry Pi 4 through the CSI (Camera Serial Interface) pins.
 752 The overall circuit is designed for a 12V system, with the +12V power supply indicated at
 753 various points. The Raspberry Pi 4's GPIO pins are used to control the relays.

754 4.3 Hardware Considerations

755 The hardware components include high-resolution cameras, lighting systems for consistent
 756 image capture, and microcontrollers like Raspberry Pi or Arduino for system control,
 757 actuators like DC and stepper motors to move the mangoes. The choice of hardware is
 758 justified based on cost, performance, and compatibility with the software framework.

759 4.3.1 General Prototype Framework

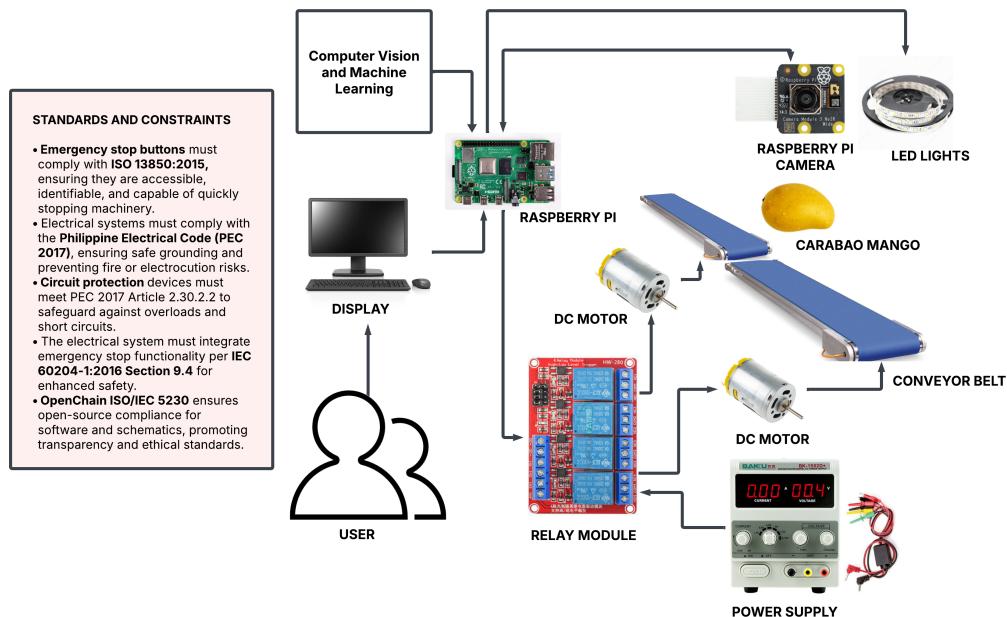

Fig. 4.2 Prototype Framework

760 The Figure 4.2 presents the overall prototype layout of the automated Carabao mango
761 sorter and grader. The diagram illustrates the flow of operations from mango loading onto
762 the conveyor belt to sorting them. It illustrates the major elements of the system, that is,
763 the image acquisition area, lighting system, camera module, Raspberry Pi controller, and
764 mechanical actuators. The layout illustrates how all the subsystems work together to ensure
765 mangoes are scanned, processed, sorted based on ripeness, size, and bruises, and eventually
766 sorted based on the calculated priority score. The layout served as the basis for actual
767 prototype development.

768 **4.3.2 Prototype Flowchart**

769 The flowchart in Figure 4.3 represents the overall operational logic of the mango grading
770 and sorting system. The process starts with system initialization, where the camera and
771 lighting modules are switched on and the machine learning algorithms are initialised. The
772 input of the user priority values as well as the detection of the mango on the conveyor
773 belt triggers the capture of both the top and bottom cheek of the mango. The captured
774 image is processed using machine learning algorithms to determine its ripeness, size, and
775 bruises. Depending on these classifications along with priority weights given by the user,
776 the system calculates an overall score. Once this calculation is done, the mango is routed to
777 the respective bin through the respective actuator. Having this logical sequence is important
778 to know the system's decision-making and automation process.

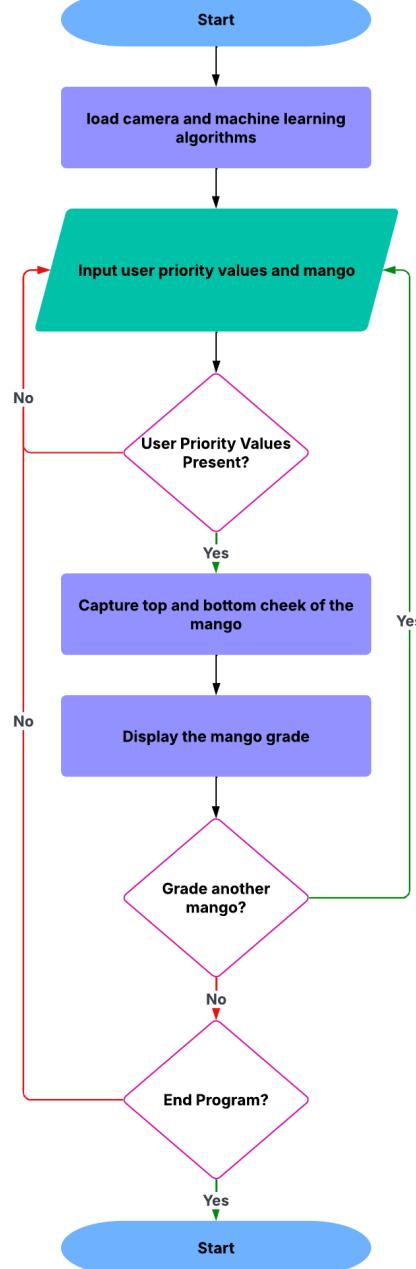

Fig. 4.3 Prototype Main Flowchart

De La Salle University

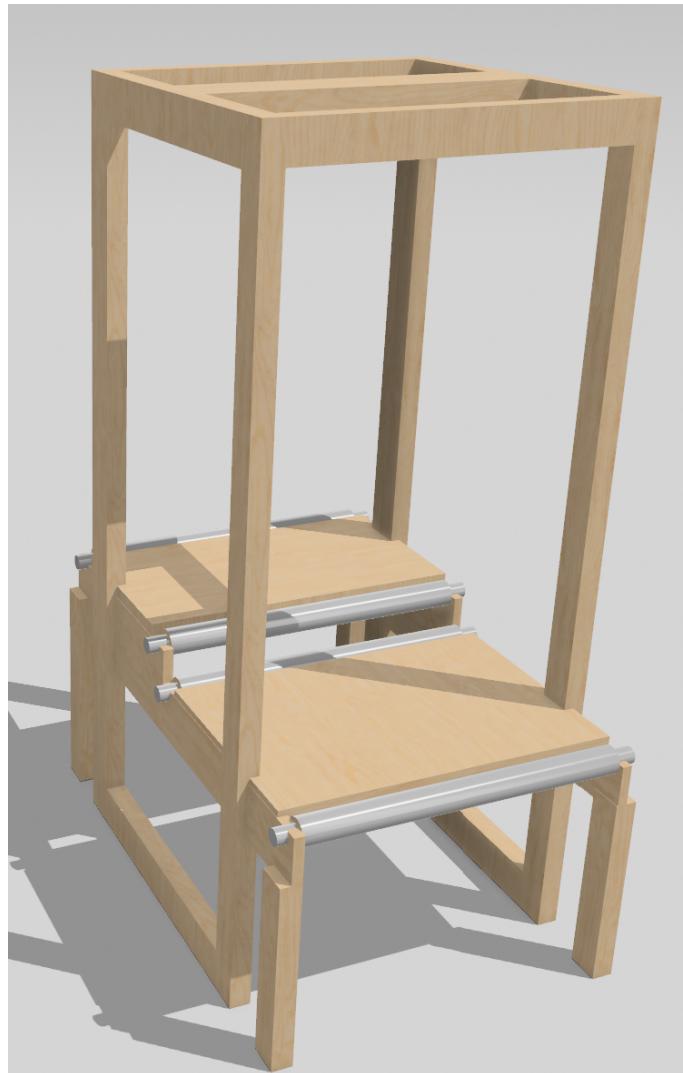

Fig. 4.4 Initial 3D Model of the Prototype

779 4.3.3 Prototype 3D Model

780 Figure 4.4 shows the first 3D model of the initial physical prototype developed for the
781 sorting and grading system. This model shows the skeleton of the system and where
782 the conveyor system is going to be placed strategically in order to flip the mango for
783 image acquisition. It is useful for where the hardware components would be arranged
784 and assembled. This 3D model helped the researchers visualize the spacing, alignment,
785 and where to mount parts before assembling the prototype making sure all electronic and
786 mechanical components are effectively integrated.

787 4.3.4 Hardware Specifications

788 4.3.4.1 Raspberry Pi

Fig. 4.5 Raspberry Pi 4 Model B

789 Figure 4.5 depicts the Raspberry Pi 4 Model B which is the core of the processing unit

790 of the prototype. It was selected due to its small size, low cost, and high computing power
791 for image processing and machine learning. The image depicts the most critical aspects
792 of the board, such as the GPIO (General Purpose Input/Output) pins for sensor, actuator,
793 and relay connections, and the USB and HDMI ports for other device connections. Its
794 capability to support a full operating system makes it suitable for supporting both the user
795 interface and the control logic of the mango grading system.

796 **Specifications:**

- 797 • SoC: Broadcom BCM2711
- 798 • CPU: Quad-core ARM Cortex-A72 (64-bit)
- 799 • Clock Speed: 1.5 GHz (base, overclockable)
- 800 • RAM: 8GB LPDDR4-3200 SDRAM
- 801 • Wireless: Dual-band 2.4 GHz / 5 GHz Wi-Fi (802.11ac)
- 802 • Bluetooth: Bluetooth 5.0 (BLE support)
- 803 • Ethernet: Gigabit Ethernet (full throughput)
- 804 • USB: 2 x USB 3.0 ports and 2 x USB 2.0 ports
- 805 • Video Output: 2 x micro-HDMI ports (supports 4K @ 60Hz, dual 4K display
806 capability)
- 807 • Audio: 3.5mm audio/video composite jack
- 808 • Storage: MicroSD card slot (supports booting via SD card or USB)

- 809 • GPIO: 40-pin GPIO header (backward-compatible with older models)
810 • Camera/Display: CSI (camera) and DSI (display) ports
811 • Power Input: USB-C (5V/3A recommended)
812 • Power Consumption: 3W idle, up to 7.5W under load

813 **4.3.4.2 Raspberry Pi Camera**

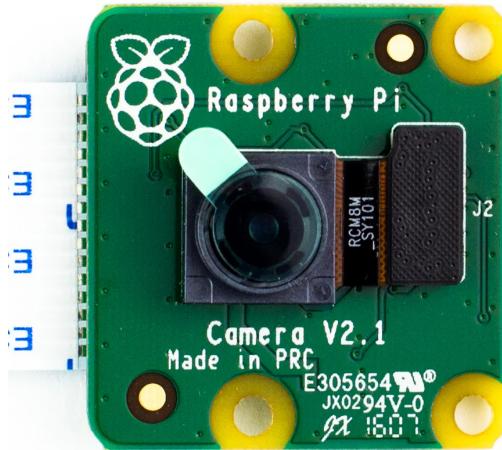

Fig. 4.6 Raspberry Pi Camera Module Version 2

814 The Raspberry Pi Camera Module Version 2 is a high-quality camera module designed
815 for the Raspberry Pi platform. Likewise, it is capable of capturing still images at 8 megapix-
816 els, and supports video recording at 1080p @ 30fps, 720p @ 60fps, and 480p @ 90fps.
817 Moreover, it has a fixed-focus lens with a diagonal field of view of 62.2 degrees, and
818 an optical format of 1/4 inch. Furthermore, it supports various Python libraries such as
819 Picamera and OpenCV for image capture and processing. As such, it was selected for its

820 compact size, ease of integration, and ability to capture high-resolution images.

821

822 **Specifications:**

823 • Sensor: Sony IMX219PQ 8-megapixel CMOS sensor.

824 • Still Images Resolution: 8 MP (3280 x 2464 pixels).

825 • Video Resolution: Supports up to 1080p @ 30fps, 720p @ 60fps, and 480p @ 90fps.

826 • Focus: Fixed-focus lens (manual focus adjustment not supported without physical
827 modification).

828 • Lens Size: 1/4-inch optical format.

829 • Field of View (FoV): Diagonal 62.2 degrees.

830 • Interface: Connected via 15-pin ribbon cable to the Raspberry Pi's CSI (Camera
831 Serial Interface) port.

832 • APIs/Libraries: Supports Python libraries such as Picamera and OpenCV for image
833 capture and processing.

834 • Dimensions: 25 mm x 24 mm x 9 mm.

835 **4.3.4.3 DC Motor**

836 The 12 Volt DC Gear Motor is a compact, high-torque, and low-noise motor suitable for a
837 wide range of applications, including robotics, automation, and industrial control systems.

838 It features a spur gear design, which provides a high reduction ratio for increased torque
839 output. The motor is designed for continuous operation and has a low power consumption

Fig. 4.7 12 Volt DC Gear Motor

under standard load conditions. Likewise, it is also capable of withstanding high temperatures and has a high reliability. This motor was selected for its high torque output, low power consumption, and compact size, making it ideal for the conveyor system.

844 **Specifications:**

- 845 • Gearbox Type: Spur gear design
- 846 • Operating Voltage: 12V (operational range: 6-12V)
- 847 • No-load Current Consumption: 0.8A
- 848 • Rated Current Draw: 3A (under standard load)
- 849 • No-load Speed: 282 RPM (maximum)
- 850 • Operating Speed: 248 RPM (under rated load)

- 851 • Torque Output: 18 kg-cm (rated)
852 • Stall Torque: 60 kg-cm (maximum)
853 • Power Rating: 50W (maximum)
854 • Unit Weight: 350 grams

855 **4.3.4.4 MicroSD Card**

Fig. 4.8 SanDisk Ultra MicroSD Card

856 The SanDisk Ultra MicroSD Card is a compact, high-capacity, and secure digital
857 memory card that is suitable for a wide range of applications, including digital cameras,
858 smartphones, and tablets. It features a high-speed data transfer rate, making it ideal for
859 storing large files such as images and videos. This card was selected for its high capacity, se-
860 cure data protection, and ease of use, making it ideal for the storage system for the prototype.

861
862 **Specifications:**

- 863 • Capacity: 256GB
864 • Type: MicroSDXC (Secure Digital eXtended Capacity)
865 • Form Factor: MicroSD (11mm x 15mm x 1mm)
866 • File System: Pre-formatted exFAT

867 **4.3.4.5 LED Lights**

Fig. 4.9 LED Light Strip

868 For the Light Emitting Diode (LED), they were used to provide consistent lighting for
869 image capture, ensuring accurate color representation and feature extraction. The LED
870 lights were selected for their energy efficiency, long lifespan, and ability to produce a
871 uniform light output.

872

873 **Specifications:**

- 874 • Power Input: 5V DC (USB-powered, compatible with laptops, power banks, or USB
875 adapters).
- 876 • Waterproof Design: Suitable for indoor/outdoor use.
- 877 • LED Type: SMD 2835 (surface-mount diodes for high brightness and efficiency).
- 878 • Color Type: White (cool white)
- 879 • Length: 1m
- 880 • Beam Angle: 120°
- 881 • Operating Temperature: -25°C to 60°C.
- 882 • Storage Temperature: -40°C to 80°C.

883 **4.3.4.6 Power Supply**

884 The bench power supply is a versatile and adjustable power source used to provide stable
885 voltage and current for various electronic projects. It is designed for testing applications,
886 allowing users to set specific voltage and current levels. This power supply was selected
887 for its versatility, ease of use, and ability to provide accurate voltage and current control for
888 the prototype.

889

890 **Specifications:**

- 891 • Type: SMPS (Switch-Mode Power Supply)
- 892 • Input: 110V AC, 50/60Hz (U.S. Standard)

Fig. 4.10 Bench Power Supply

- 893 • Output Range: 0-30V DC / 0-5A DC
- 894 • Voltage Precision: $\pm 0.010V$ (10 mV) resolution
- 895 • Current Precision: $\pm 0.001A$ (1 mA) resolution
- 896 • Power Precision: $\pm 0.1W$ resolution
- 897 • Weight: 5 lbs (2.27 kg)
- 898 • Dimensions: 11.1" x 4.92" x 6.14" (28.2 cm x 12.5 cm x 15.6 cm)
- 899 • Maximum Power: 195W
- 900 • Power Source: AC input only

Fig. 4.11 4 Channel Relay Module

4.3.4.7 4 Channel Relay Module

The 4 Channel Relay Module is a compact and versatile relay board that allows for the control of multiple devices using a single microcontroller. This module was selected for its compact size, ease of use, and ability to control multiple devices simultaneously. It is designed to be used with microcontrollers such as Arduino and Raspberry Pi, allowing for easy integration into the prototype.

Specifications:

- Operating Voltage: 5V DC (compatible with Arduino, Raspberry Pi, and other microcontrollers).
- Number of Relays: 4 independent channels.
- Relay Type: Electromechanical (mechanical switching).

- 913 • Max AC Load: 10A @ 250V AC (resistive).
- 914 • Max DC Load: 10A @ 30V DC (resistive).
- 915 • Contact Type: SPDT (Single Pole Double Throw) - NO (Normally Open), NC
916 (Normally Closed), COM (Common).
- 917 • Dimensions: 50mm x 70mm x 20mm
- 918 • Weight: 50-80 grams.
- 919 • Status LEDs: Individual LEDs for each relay (indicates ON/OFF state).
- 920 • Input Pins: 4 digital control pins (one per relay).
- 921 • Output Terminals: Screw terminals for connecting loads (NO/NC/COM).

922 **4.4 Software Considerations**

923 The software stack includes Python for programming PyTorch for machine learning and
924 OpenCV for image processing. These tools are selected for their robustness, ease of use,
925 and extensive community support, ensuring efficient system development.

926 **4.4.1 PyTorch**

927 PyTorch is an open-source deep-learning framework used in this project for implementing
928 and running the convolutional neural networks responsible for classifying mango ripeness
929 and detecting bruises. Its dynamic computational graph and GPU acceleration support
930 made it an ideal choice for real-time image classification. Its simplicity and flexibility also

931 allowed for easy integration with the Raspberry Pi which is important as it is the main
932 processing unit for the system.

933 **4.4.2 OpenCV**

934 Open Source Computer Vision Library or OpenCV is utilized in the system for all image
935 processing tasks, particularly in preprocessing steps such as background subtraction, thresh-
936 olding, edge detection, and contour analysis. These operations are essential for calculating
937 the real-world dimensions of the mango. OpenCV was utilized primarily because of its
938 diverse set of functions, performance optimization, and ease of use making it a core tool
939 for enabling accurate and fast computer vision processing within the prototype.

940 **4.4.3 CustomTkinter**

941 CustomTkinter is a modern alternative to the standard Tkinter library, and is used to
942 build the graphical user interface (GUI) of the system. It provides a more polished and
943 customizable visual appearance while retaining the simplicity of Tkinter. With features
944 such as styled buttons, frames, and labels, CustomTkinter allowed for the creation of
945 a user-friendly interface that supports real-time display of classification results, priority
946 scoring inputs, and system status updates.

947 **4.5 Security and Reliability Considerations**

948 Potential vulnerabilities, such as data corruption during image capture, are addressed
949 through redundancy and error-checking mechanisms. Reliability is ensured by implement-
950 ing fault-tolerant designs and rigorous testing protocols.

4.6 Scalability and Efficiency Considerations

The system is designed to handle large volumes of mangoes by optimizing the machine learning model and using parallel processing techniques. Efficiency is improved through techniques like model quantization and hardware acceleration.

4.7 User Interface

A User Interface (UI) is designed to display grading results, system status. Wireframes illustrate the layout, ensuring usability and accessibility for operators. Likewise, a Graphical User Interface (GUI) is also used to allow users to customize the system's grading priorities.

4.8 Constraints and Limitations

Challenges include variations in mango appearance due to lighting and environmental factors. Trade-offs are made between model complexity and real-time performance to balance accuracy and speed.

4.9 Technical Standards

The system adheres to industry standards for image processing and machine learning, ensuring compatibility and interoperability with other systems.

4.10 Prototyping and Simulation

Prototypes are developed using tools like MATLAB and Simulink to simulate the system's performance. These simulations help identify design flaws and optimize the system before deployment.,

4.11 Design Validation

The design is validated through testing, including unit testing of individual modules and integration testing of the entire system. Peer reviews and iterative improvements ensure the system meets the desired performance metrics.

4.12 Summary

This chapter outlined the key design considerations, including system architecture, hardware and software choices, and validation methods. These decisions are critical for developing a reliable and efficient mango sorting and grading system.

980 5.1 Introduction

981 The methodology for this research outlines the development of the Carabao Mango sorter
982 using machine learning and computer vision. The sorting system uses a conveyor belt
983 system which delivers the mangoes into the image acquisition system. This system captures
984 the image of the mangoes which will then be going through the various stages of image
985 processing and classification into grades which will depend on the priority of the user.
986 This methodology ensures that the grading of the mangoes will be accurate while being
987 non-destructive.

988 5.2 Research Approach

989 This study applies the experimental approach for research in order to develop and properly
990 test the proposed system. The experimental approach of the methodology will allow the
991 researchers to fine-tune the parameters and other factors in the classification of mangoes in
992 order to get optimal results with high accuracy scores while maintaining the quality of the
993 mangoes. This approach will also allow for real-time data processing and classification
994 which will improve the previous static grading systems.

995 5.3 Hardware Design

996 The prototype consists of hardware and software components for automated mango sorting
997 and grading purposes. The hardware includes the conveyor belt system used to transfer
998 mangoes from scanning to sorting smoothly. A camera and lighting system are able
999 to collect high-resolution images for analysis. The DC motors and stepper motors are

1000 responsible for driving the conveyor belt and sorting actuators. The entire system is
1001 controlled by a microcontroller (Raspberry Pi 4b), coordinating actions of all components.
1002 Sorting actuators then direct mangoes into selected bins based on their classification to
1003 make sorting efficient.

1004 **5.4 Software Design**

1005 For the programming language used for the prototype and training and testing the CNN
1006 model, Python was used for training and testing the CNN model and it was also used in the
1007 microcontroller to run the application containing the UI and CNN model. PyTorch was the
1008 main library used in using the EfficientNet model that is used in classifying the ripeness
1009 and bruises of the mango. Likewise, tkinter is the used library when designing the UI in
1010 Python.

1011 Furthermore, the rest of the software components are of utmost importance to mango
1012 classification. Image processing algorithms in OpenCV and CNN models extract features
1013 such as color, size, and bruises that are known to determine quality parameters of mangoes.
1014 Mangoes are classified based on ripeness and defects by using machine learning algorithms,
1015 which further enhances accuracy using deep learning techniques. A user interface (UI) is
1016 designed for users to control and observe the system in real time. Finally, the interface
1017 programming of the microcontroller provides the necessary synchronization between
1018 sensors, actuators, and motors throughout the sorting operation scenario.

1019 5.5 Data Collection Methods

1020 For the data collection, online available image datasets with Carabao mangoes were used
1021 together with the captured Carabao mango images. For the setup of the captured Carabao
1022 mangoes, the height of the camera to the white flat surface is 26 cm which can be seen
1023 on Figure 5.1. Furthermore, the S24's camera is used for capturing both cheeks of the
1024 Carabao mango. Initially, the Carabao mangoes would be unripe and green and each day
1025 the Carabao mangoes would be pictured until they are ripe.

Fig. 5.1 Carabao Mango Image Data Collection

1026 5.6 Testing and Evaluation Methods

1027 In a bid to ensure the mango sorting and grading system is accurate and reliable, there is
1028 intensive testing conducted at different levels. Unit testing is initially conducted on each
1029 component separately, for instance, the conveyor belt, sensors, and cameras, to ensure that

1030 each of the components works as expected when operating separately. After component
 1031 testing on an individual basis, integration testing is conducted to ensure communication
 1032 between hardware and software is correct to ensure the image processing system, motors,
 1033 and sorting actuators work in concert as required. System testing is conducted to con-
 1034 duct overall system performance testing in real-world conditions to ensure mangoes are
 1035 accurately and efficiently sorted and graded.

5.6.1 Classification Report

5.6.1.1 Confusion Matrix

	Predicted Positive	Predicted Negative
Actual Positive	TP	FN
Actual Negative	FP	TN

TABLE 5.2 CONFUSION MATRIX EXAMPLE

1038 A confusion matrix is a table that visualizes the performance of a classification model.
 1039 For a binary classification problem, it has four components:

- 1041 • True Positives (TP): Cases correctly predicted as positive
- 1042 • True Negatives (TN): Cases correctly predicted as negative
- 1043 • False Positives (FP): Cases incorrectly predicted as positive. (Type I error)
- 1044 • False Negatives (FN): Cases incorrectly predicted as negative (Type II error)

1045 **5.6.1.2 Precision**

$$\text{Precision} = \frac{TP}{TP + FP} \quad (5.1)$$

1046 Precision measures how many of the predicted positives are actually positive. It answers
 1047 the question: "When the model predicts the positive class, how often is it correct?" High
 1048 precision means low false positives.

1049 **5.6.1.3 Recall**

$$\text{Recall} = \frac{TP}{TP + FN} \quad (5.2)$$

1050 Recall, which is also called sensitivity, measures how many of the actual positives were
 1051 correctly identified. It answers the question: "Of all the actual positive cases, how many
 1052 did the model catch?" High recall means low false negatives.

1053 **5.6.1.4 F1 Score**

$$F_1 = 2 \times \frac{\text{Precision} \times \text{Recall}}{\text{Precision} + \text{Recall}} \quad (5.3)$$

1054 The F1 score is the harmonic mean of precision and recall. It provides a single metric
 1055 that balances both concerns. This is particularly useful when you need to find a balance
 1056 between precision and recall, as optimizing for one often decreases the other.

1057 **5.6.1.5 Accuracy**

$$\text{Accuracy} = \frac{TP + TN}{TP + TN + FP + FN} \quad (5.4)$$

1058 Accuracy measures the proportion of correct predictions (both true positives and true
1059 negatives) among the total cases. While intuitive, accuracy can be misleading with imbal-
1060 anced datasets.

1061 To test system performance, various measures of performance are used to evaluate.
1062 As seen on equation 5.4, accuracy score is used to measure the percentage of correctly
1063 classified mangoes to ensure the system maintains high precision levels. Precision as seen
1064 on equation 5.1 and recall as seen on equation 5.2 are used to measure consistency of
1065 classification to determine if the system classifies different ripeness levels and defects
1066 correctly. Furthermore, the F1 score formula as seen on equation 5.3 is used to evaluate the
1067 performance of the model's classification.

1068 A confusion matrix is used to measure correct and incorrect classification to ensure the
1069 machine learning model is optimized and that minimum errors are achieved. Throughput
1070 analysis is also used to determine the rate and efficiency of sorting to ensure that the
1071 system maintains high capacity without bottlenecks to sort mangoes. Using these methods
1072 of testing, the system is constantly optimized to ensure high-quality and reliable mango
1073 classification.

1074 **5.6.2 Ripeness Training and Testing**

1075 For the testing of the ripeness classification, the Carabao mangoes are classified into three
1076 ripeness stages which are Green, green yellow, and yellow. Likewise, The green would
1077 represent the ripe mangoes while the green yellow would represent the semi ripe while the
1078 yellow would represent the ripe mangoes. As reference, Figure 5.3 shows the different
1079 ripeness stages for Carabao/Pico mangoes.

Annex A

Stages of ripeness of 'carabao' and 'pico' mango fruits

Stage of ripeness	Peel color	Flesh color
Green	Completely light green	Yellowish white or light yellow green
Breaker	Traces of yellow	Middle area and fruit outline yellowish; other areas, white to yellowish white
Turning	More green than yellow	More yellow than white
Semi-ripe	More yellow than green	Yellow for 'carabao'; yellow orange for 'pico'
Ripe	80-100% yellow ('carabao') or yellow orange ('pico')	Middle area yellow for 'carabao'; yellow orange for 'pico'
Overripe	Yellow for 'carabao'; yellow orange for 'pico'	100% yellow for 'carabao' and yellow orange for 'pico'

Fig. 5.2 Carabao Mango Ripeness Stages

5.6.3 Bruises Training and Testing

For the testing of the bruise classification of the Carabao mangoes, it would classified into two categories which are bruised and not bruised. To define what bruise and not bruise mangoes looked like Figure 5.3 is used as reference to categorize which mangoes are bruised and not bruised.

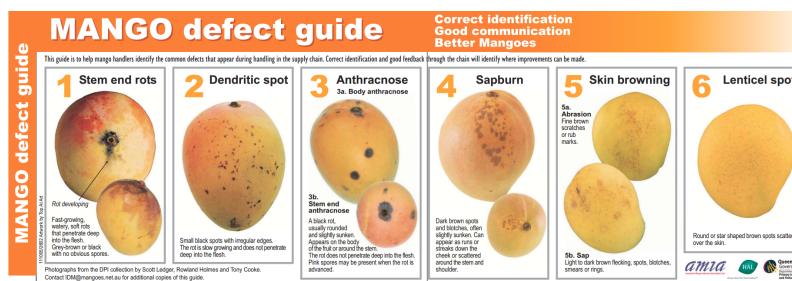

Fig. 5.3 Different Kinds of Mango Defects

1085 **5.6.4 Size Determination**

1086 To get the size of the mangoes, computer vision techniques such as Gaussian Blur and
1087 Thresholding are used to get the length and width of the mangoes.

1088 **5.7 Formula for User Priority**

1089 **5.8 Ethical Considerations**

1090 Ethical considerations ensure that the system is operated safely and responsibly. Data
1091 privacy is ensured by securely storing and anonymizing extracted images and classification
1092 data so that unauthorized access becomes impossible. The system is also eco-friendly
1093 through non-destructive testing, saving mangoes while also ensuring that they are of good
1094 quality. Safety in operations is also ensured by protecting moving parts to prevent mechani-
1095 cal harm and incorporating fail-safes to securely stop operation in case of malfunction.
1096 Addressing these concerns, the system is not only accurate and efficient but also secure,
1097 eco-friendly, and safe for operators, thus a sustainable solution to automated mango sorting
1098 and grading.

1099 **5.9 Summary**

1100 This chapter explained how to create an automatic Carabao mango sorter and grader using
1101 machine learning and computer vision. The system integrates hardware and software
1102 resources, including a conveyor belt, cameras, sensors, and actuators, to offer accurate,
1103 real-time sorting by ripeness, size, and bruises. Various testing and evaluation processes

1104 ensure its performance to offer reliability. Ethical issues are data privacy, environmental
1105 sustainability, and operation safety. With enhanced efficiency, reduced human error, and
1106 enhanced quality, this system provides an affordable, scalable, and non-destructive solution
1107 to post-harvest mango classification in agricultural industries.

6.2 Size Determination Results

6.3 User Priority Formula

$B(P)$ and $R(P)$ and $S(P)$ are the User Priority-Based Grading for bruises, ripeness, and size of the Carabao mango. Furthermore, $b(p)$ and $r(p)$ and $s(p)$ are the machine learning's predictions for bruises, ripeness, and size of the Carabao mango. The formula for the user priority is given by:

$$\text{User Priority} = b(P)B(P) + r(P)R(P) + s(P)S(P) \quad (6.1)$$

1126 **Chapter 7**

1127 **CONCLUSIONS, RECOMMENDATIONS, AND**
1128 **FUTURE DIRECTIVES**

1129 7.1 Concluding Remarks

1130 In this Thesis, the prototype is successful in grading and sorting Carabao mangoes based
1131 on the user priority and machine learning algorithm. More specifically, the prototype
1132 is successful in automatically classifying Carabao mangoes based on ripeness (Green,
1133 Green Yellow, and Yellow), size (Large, Medium, Small), and bruises (bruised and not
1134 bruised)

1135 7.2 Contributions

1136 The contributions of each group member are as follows:

- 1137 • BANAL Kenan A.: Scrum Master (Project manager in charge of the hardware and
1138 software integration)
- 1139 • BAUTISTA Francis Robert Miguel F.: Front End Engineer (UI/UX Designer in
1140 charge of software interface and hardware assistant of the Scrum Master)
- 1141 • HERMOSURA Don Humphrey L. : Back End Engineer (Software Engineer in
1142 charge of the machine learning algorithm and software assistant of the Scrum Master)
- 1143 • SALAZAR Daniel G.: Product Engineer (Software Engineer in charge of training
1144 and testing of the machine learning algorithm)

1145 7.3 Recommendations

1146 The researchers recommend that the prototype be improved in the optimization of the
1147 machine learning algorithm and the hardware design. The researchers also recommend that

1148 the prototype be tested in the actual grading and sorting of Carabao mangoes in the market.

7.4 Future Prospects

1150 Future researchers may consider the following recommendations for future work:

- 1151 1. User testing of the prototype in the actual grading and sorting of Carabao mangoes
1152 in the Philippine market.
- 1153 2. Additional of weight measurement to the prototype to improve the grading and
1154 sorting of Carabao mangoes.
- 1155 3. Integration of a custom PCB to improve the hardware design of the prototype.

7. Conclusions, Recommendations, and Future Directives

A. Student Research Ethics Clearance

De La Salle University

1159

RESEARCH ETHICS CLEARANCE FORM ¹ For Thesis Proposals	
Names of Student Researcher(s): BANAL, Kenan A. BAUTISTA, Francis Robert Miguel F. HERMOSURA, Don Humphrey L. SALAZAR, Daniel G	
College: GCOE	
Department: ECE	
Course: Computer Engineering	
Expected Duration of the Project: from: January 4 2025 to: January 4 2026	
Ethical considerations (The Ethics Checklists may be used as guides in determining areas for ethical concern/consideration)	
 To the best of my knowledge, the ethical issues listed above have been addressed in the research. Dr. Reggie C. Gustilo	
Name and Signature of Adviser/Mentor: Date: February 5, 2025	
Noted by: Dr. Argel Bandala	
Name and Signature of the Department Chairperson: Date: February 6, 2025	

¹ The same form can be used for the reports of completed projects. The appropriate heading need only be used.

Appendix B ANSWERS TO QUESTIONS TO THIS THESIS

1161

B1 How important is the problem to practice?

A possible answer to this question is the summary of your Significance of the Study, and that portion of the Problem Statement where you describe the ideal scenario for your intended audience.

1162 Lorem ipsum dolor sit amet, consectetuer adipiscing elit. Etiam lobortis facilisis sem.

Panelist's Comments and Revisions	Action Taken	Page Number
Capture both two sides of the mango and not just one to remove error	The image capturing system would only capture the two sides of the mango which are the two largest surface areas of the skin.	18
How will you get large dataset with sweetness and how will you classify it?	Remove Sweetness in the SO	13
Size and weight are not the same.	Remove Weight in objectives but retained size in the SO4 and SO6	
Specify in the specific objectives that it will be automatic sorting	SO1: To make an image acquisition system with a conveyor belt for automatic sorting and grading mangoes.	13
Add what process will be used to get the size classification	SO6: To classify mango size by getting its length and width using OpenCV, geometry, and image processing techniques	13
Add what process the ripeness classification will be	SO5: To classify mango ripeness using kNN or nearest neighbors algorithm	13
Get rid of texture in the general objectives	Texture is removed in the SOs	13
Get rid of CNN in general objectives and replace with machine learning	CNN is removed and replaced with machine learning GO: To develop a user-priority-based grading and sorting system for Carabao mangoes, using machine learning to assess ripeness, size, and bruises.	13
Remove Raspberry Pi on the SO's and generalize to "to create a microcontroller based application"	SO3: To create a microcontroller application to operate and control the prototype.	13
Remove SO4. No need for user testing	Removed user test and the new SO4 is SO4: To grade mangoes based on user priorities for size, ripeness, and bruises.	13
Fix IPO to the correct input and output	Input: Two side image of the Carabao Mango and the User Priority Attributes Process: Machine Learning Algorithm, Grading Formula, and CNN model using a microcontroller Output: Size, Ripeness, and Bruises	20

PRO1 Panel Comments and Revisions – Appendix Z

PRO1 Panel Comments and Revisions

Zoom Recording:

https://zoom.us/rec/share/mrn9zBtPz3bJ5laVcy2E8-iBno8A6fBRgOCacMrhmzLPCNO0IDxXBHiK_xzdicEb.MzbHGzrD7rL3tVgJ?startTim=e=1731326444000
 Passcode: +?qL6DZE

Summary:

- Specific Objectives
- Add:
 - what process will be used to get the sweetness classification
 - what process the ripeness classification will be
 - what process will be used to get the size classification
 - Specify in the specific objectives that it will be automatic sorting
- Remove:
 - get rid of texture in the general objectives
 - get rid of cnn in general objectives and replace with machine learning
 - remove Raspberry Pi on the SO's and generalize to "to create a microcontroller based application"
 - remove SO4. No need for user testing

Comments:

- *[00-00] time stamps from recording
 - [15:00] Why only the top side of the mango? Isn't the point of automation to reduce human error? Then what about the bottom side wouldn't that just introduce another error if the mango happens to have defects on the bottom?
 - [16:09] What is the load cell for? Size is not the same as weight. if size is taken from the weight wouldn't size be also taken from the image. if size then adding a load cell would just introduce more complexity, if weight then load cell is fine. reminder that size is not the same as weight.
 - [17:36] When computer vision, state input and output parameters. Output parameters in this case would be sweetness, ripeness, size and bruising. Input parameters would be images.
 - [18:12] No mention of how the dataset would be gathered. Would you be gather your own dataset or using a publicly available dataset
 - [21:38] Fix IPO based on mention input and output parameters.
 - [21:50] Dataset is lacking. Usually in machine learning at least 10,000 images. can take more than one image per mango. after taking an image of mango can make more out of the image using data augmentations.
 - [22:48] Add to specific Objectives the mentioned 80%
 - [23:09] Consultant that would grade the mangoes as a third party to remove biases. For both the testing and the training
 - [24:55] How do you detect the sweetness of mangoes? Add these to the specific objectives. What are the categories of sweetness? Add these to specific objectives. How do

1398

PRO1 Panel Comments and Revisions – Appendix Z

you detect the correct categorization of sweetness? How to automate the classification of the sweetness.

- [33:10] Why is the dataset destructive but the testing non destructive? Clarify this further to avoid confusion.
- [35:09] What is the basis of sweetness using images? Clarify this further.
- [35:35] How would you know if the classifier is correct or not? What is your ground truth (for the sweetness)?
- [38:55] When can you say you are getting the top side of the mango? How would you know if the mango images showing the top side or the bottom side of both cheeks of the mango can be captured? If it doesn't matter then any side can be captured so why is it in the limitations that only the top side can be captured. Clarify the limitations.
- [48:10] What classifier would you use here? What features would you extract from the images?
- [52:07] Does it explain what process will be used to get the sweetness classification? Add it to the specific objectives
- [54:00] How will ripeness be classified? Will it use the same dataset as the sweetness classification did? How was ground truth obtained?
- [55:44] Why not the nearest neighbor? It is more fit in this scenario. Do not specify CNN in the objectives. The embedded systems as well, do not specify the Raspberry pi unless truly sure
- [57:30] Table is just image processing. Is there a specific objective that would describe how ripeness classification will be done? Add this to the specific objectives.
- [59:10] How is the weight obtained? Add it to the specific objectives. Remember that size is not proportional to weight. Size could be obtained from the image as the camera is from a fixed distance. Add to specific objectives how to get the size
- [1:00:00] get rid of texture in the general objectives. get rid of cnn in general objectives and replace with machine learning. as each parameter will use a different method.
- [1:04:00] remove Raspberry Pi on the SO's and generalize to "to create a microcontroller based application"
- [1:04:37] remove SO4. no more user testing
- [1:05:00] The formula used for grading the mangoes, is this used as industry standard? How do they measure the export quality of mango
- [1:07:00] Specify in the specific objectives that it will be automatic sorting

Here are my comments on my end :)

1. Ensure seamless integration between hardware (sensors, motors, etc.) and software (CNNs, Raspberry Pi). You can consider using a modular approach for easier troubleshooting.
2. How do you gather a comprehensive and diverse dataset for training your CNN. This will enhance the model's robustness and accuracy.
3. Make sure that the weight sensors are calibrated correctly to avoid measurement errors.

C. Revisions to the Proposal

De La Salle University

1399

PRO1 Panel Comments and Revisions – Appendix Z

4. Implement data augmentation techniques to enhance your image dataset, which can improve model generalization and accuracy.
5. Design an intuitive user interface for the Raspberry Pi application.
6. Besides precision, recall, and F1 score, consider incorporating confusion matrices to better understand model performance and error types.
7. Conduct user testing of the application to gather feedback on usability and functionality. This can lead to improvements in design and user experience. Consider how the system can be scaled or adapted for different fruits or larger processing volumes in the future.
