42 **Suggestions for choosing the title of your document:** The title must be reflective of its
43 problem. Use the following checklist to help you in making the title.

- 44 **WHAT** question: Will answer the following
- 45 Did you put what you are trying to investigate?
- 46 Did you indicate what you are trying to find out, determine or discover?
- 47 **WHO** question: Will answer who are the respondents or subjects of the study
- 48 **WHERE** question: Will indicate the research locale, setting or the place where the
49 research study is conducted or where it can be applied.

54

ACKNOWLEDGMENT

55

We would like to acknowledge our external advisor Dr. Cecilia Reyes for giving her insight and help in the classification and mango grading in the Philippines.

56

Write this prior to binding your thesis if you have submitted necessary requirements and are told by the university that you have passed.

238 GLOSSARY

239	accuracy score	A performance metric that measures the overall proportion of correct predictions made by a machine learning model.
240	bruises	The black or brown area of the mango that is visible on the skin of the mango.
241	Carabao mango	A popular variety of mango grown in the Philippines, known for its sweet and juicy flesh.
242	CNN	A type of deep neural network that is highly effective in analyzing and processing visual data, such as images.
243	computer vision	The use of cameras and algorithms to provide imaging-based inspection and analysis.
244	confusion matrix	A table that summarizes the performance of a classification model, showing the number of true positives, true negatives, false positives, and false negatives.
245	F1-Score	A balanced performance metric that is the harmonic mean of precision and recall, taking both into account.
246	machine learning	A subset of Artificial Intelligence that enables systems to learn and improve from data.
247	microcontroller	A small computing device that controls other parts of a system such as sensors.
248	Precision	A performance metric that reflects the percentage of instances classified as positive that are truly positive.
249	recall	A performance metric that measures the proportion of actual positive instances that the model correctly identified.

Chapter 1

253

INTRODUCTION

254 **1.1 Background of the Study**

255 Mangoes, also known as the *Mangifera indica*, are a member of the cashew family. This
256 fruit can often be seen being farmed by countries such as Myanmar, the Philippines, and
257 India as they have a tropical dry season. Being in a tropical country is an important
258 aspect for mango cultivation as it ensures proper growth for mangoes. If aspects such as
temperature and rainfall are not ideal, it may affect the quality of the mango (?). Carabao

259 Fig. 1.1 Carabao Mangoes at Different Ripeness Stages (?)

260 mangoes is a variety of a mango that is found and cultivated in the Philippines. It is known
261 for its sweet signature taste that was recognized sweetest in the world in the Guinness
262 Book of World Records in 1995. The mango was named after the national animal of the
263 Philippines, a native breed of buffalo. On average, it is 12.5 cm in length and 8.5 cm in
264 diameter, having a bright yellow color when ripe as seen in Figure 1.1. It is often cultivated
265 during late May to early July (?).

266 As the Philippines is a tropical country, mangoes are a highly valued fruit as it is not
267 only the country's national fruit but also amongst the leading agricultural exports of the
268 country, ranking only third below bananas and pineapples. This gives the country the 9th
269 slot amongst the leading exporters of Mangoes across the world. Attributed to this ranking

De La Salle University

270 is the country's export of both fresh and dried mangoes, as well as low tariff rates. This
271 allows the country to export a large quantity of the fruit in countries such as Singapore,
272 Japan, and the USA as they can enter duty free markets provided by the World Trade
273 Organization and Japan. Due to this, the mangoes have become a major source of income
274 to an estimated 2.5 million farmers in the country (?).

275 Before mangoes are sold in markets, they first undergo multiple post-harvest processes.
276 This is to ensure that the mangoes that arrive in markets are utmost quality before being
277 sold to consumers. Moreover, it ensures that mangoes are contained and preserved properly
278 such that they do not incur damages and/or get spoiled on its transportation to the market.
279 Processing of the mango involves pre-cooling, cleaning, waxing, classification, grading,
280 ripening, packaging, preservation, storage, packing, and transportation (?) (?).

281 Among the processes that mangoes undergo, classification and grading is important as
282 it allows the manufacturer to separate mangoes with good qualities versus mangoes with
283 poor qualities. According to a study by (?), size, length, width, volume, density, indentation,
284 and grooves are aspects that determine the maturity of mangoes. These traits are being
285 checked along with the ripeness of the mango, sightings of bruise injury, and cracks on the
286 fruit (?) as these aspects affect the sellability of the fruit as well as the chances of it getting
287 spoiled sooner.

288 Previous studies have been made to automate the sortation process of the mangoes.
289 Among these is a research done by ?, which focuses on classification of mangoes using their
290 texture and shape features. They do this by, first, acquiring an image of the mango using
291 a digital camera. Then, these images are fed to the MaZda package, which is a software
292 originally developed for magnetic resonance imaging. Within the MaZda package is the
293 B11 program, which uses Principal Component Analysis, Linear Discriminant Analysis,

294 Nonlinear Discriminant Analysis, and texture classification to extract features from the
295 mango, which in this case are the length, width, and texture. This data is then compared to
296 a database in order to classify any given mango (?).

297 Another study is done by ?, which classifies mangoes based on their color, volume, size,
298 and shape. This is done by making use of Charge Coupled Devices, Complementary Metal-
299 Oxide Semiconductor sensors, and 3-layer Convolutional Neural Network. To classify the
300 mangoes, images are first captured and preprocessed to be used as a data set (?). This data
301 set is then augmented to be used as a model for the 3-layer Convolutional Neural Network.
302 After extracting the features of the mango, the 3-layer Convolutional Neural Network
303 is used as a method for their classification as it can mimic the human brain in pattern
304 recognition, and process data for decision making. This is important as some mangoes have
305 very subtle differences which make it difficult to differentiate them.

306 1.2 Prior Studies

307 A paper written by ?, designed an automated fruit sorting machine based on the quality
308 through an image acquisition system and CNN. Furthermore, the results of the paper show
309 that the image processing detection score was 89% while that of the tomatoes was 92%
310 while the CNN model had higher validity of 95% for mangoes and 93% for tomatoes.
311 15%, while the percentage of distinction between the two groups was reported to be 5%
312 respectively (?). Despite the high accuracy score in detecting mango defects, the fruit
313 sorting system only sorts based on the mango defects and not on ripeness, and weight.

314 Furthermore, the research paper presented by ? designed an Automated Carabao mango
315 classifier, in which the mango image database is used to extract the features like size, area

316 along with the ratio of the spots for grading using Naïve Bayes Model. For the results, the
317 Naïve Bayes' model recognized large and rejected mangoes with 95% accuracy and the
318 large and small/medium difference with a 7% error, suggesting an application for quality
319 differentiation and sorting in the mango business industry. Despite the high accuracy of
320 classifying Carabao mangoes, the researchers used a high quality DSLR camera for the
321 image acquisition system without any microcontroller to control the mangoes (?).

322 **1.3 Problem Statement**

323 As mangoes are among the top exports of the Philippines (?), assessing the physical
324 deformities is a necessity. The physical deformities of the Carabao mango can determine
325 the global competitiveness of the country. Having higher quality exports can often lead to
326 gaining competitive edge, increase in demand, increase export revenues, and becoming less
327 susceptible to low-wage competition (?). In order to increase the quality of mango fruit
328 exports, a key post-harvest process is done, which is sorting and grading. Mango sorting
329 and grading then becomes important to determine which batches are of high quality and can
330 be sold for a higher price, and which batches are of low quality and can only be sold for a
331 low price (?). Traditionally, fruit sorting and grading is inefficient as it is done manually by
332 hand. Some tools are used such as porous ruler to determine fruit size and color palette for
333 color grading (?). However, among the problems encountered in the process of manually
334 sorting and grading mangoes are susceptibility to human error and requiring a number of
335 laborers to do the task.

336 With the current advancements in technology, some researchers have already taken steps
337 to automate the process of sorting and grading mangoes. However, these attempts would

338 often only consider some of the aspects pertaining to size, ripeness, and bruises but not all
339 of them at the same time. Lastly, not all research approaches were able to implement a
340 hardware for their algorithm, limiting their output to only a software implementation and not
341 an embedded system. As such the proposed system would assess the export quality of the
342 Carabao mango based on all the mentioned mango traits, namely size, bruises, and ripeness
343 while also taking into consideration being non-destructive. These aspects are important
344 because, as was previously mentioned, there is a need to develop a Carabao mango sorter
345 that takes into account all these aspects at the same time while being non-destructive.

346 **1.4 Objectives and Deliverables**

347 **1.4.1 General Objective (GO)**

- 348 • GO: To develop a user-priority-based grading and sorting system for Carabao man-
349 goes, using machine learning and computer vision techniques to assess ripeness, size,
350 and bruises. ;

351 **1.4.2 Specific Objectives (SOs)**

- 352 • SO1: To make an image acquisition system with a conveyor belt for automatic sorting
353 and grading mangoes. ;
- 354 • SO2: To get the precision, recall, F1 score, confusion matrix, and train and test
355 accuracy metrics for classifying the ripeness and bruises with an accuracy score of at
356 least 90%;

- 357 • SO3: To create a microcontroller-based system to operate the image acquisition
 358 system, control the conveyor belt, and process the mango images through machine
 359 learning. ;
- 360 • SO4: To grade mangoes based on user priorities for size, ripeness, and bruises. ;
- 361 • SO5: To classify mango ripeness based on image data using machine learning
 362 algorithms such as kNN, k-mean, and Naïve Bayes. ;
- 363 • SO6: To classify mango size based on image data by getting its length and width
 364 using OpenCV, geometry, and image processing techniques. ;
- 365 • SO7: To classify mango bruises based on image data by employing machine learning
 366 algorithms.

367 **1.4.3 Expected Deliverables**

368 Table 1.1 shows the outputs, products, results, achievements, gains, realizations, and/or
 369 yields of the Thesis.

TABLE 1.1 EXPECTED DELIVERABLES PER OBJECTIVE

Objectives	Expected Deliverables
GO: To develop a user-priority-based grading and sorting system for Carabao mangoes, using machine learning and computer vision techniques to assess ripeness, size, and bruises.	<ul style="list-style-type: none"> • To develop a Carabao mango grading and sorting system. • To grade Carabao mangoes into three categories based on ripeness, size, and bruises using machine learning. • To integrate sensors and actuators to control the conveyor belt and image acquisition system.

Continued on next page

TABLE 1.1 EXPECTED DELIVERABLES PER OBJECTIVE

Objectives	Expected Deliverables
SO1: To make an image acquisition system with a conveyor belt for automatic sorting and grading mangoes.	<ul style="list-style-type: none"> To make an image acquisition system with a camera and LED light source. To build a flat belt conveyor for moving the mangoes.
SO2: To get the precision, recall, F1 score, confusion matrix, and train and test accuracy metrics for classifying the ripeness and bruises with an accuracy score of at least 90%.	<ul style="list-style-type: none"> To use a publicly available dataset of at least 10,000 mango images for classification of ripeness and bruises.
SO3: To create a microcontroller-based system to operate the image acquisition system, control the conveyor belt, and process the mango images through machine learning.	<ul style="list-style-type: none"> To develop an intuitive UI where users can start and stop the system. To implement a priority-based grading system with sliders for ripeness, bruises, and size.
SO4: To grade mangoes based on user priorities for size, ripeness, and bruises.	<ul style="list-style-type: none"> To utilize a linear combination formula as the overall mango score, where each classification level contributes a grade, weighted by the priority assigned to the three properties. To assign score values for each classification level of the mango.
SO5: To classify mango ripeness based on image data using machine learning algorithms such as kNN, k-mean, and Naïve Bayes.	<ul style="list-style-type: none"> To train a machine learning model such as kNN, k-means, or Naïve Bayes capable of classifying mango ripeness based on the image color. To gather a dataset of annotated images with ripeness labels. To obtain an evaluation report of performance metrics of the model.
SO6: To classify mango size based on image data by getting its length and width using OpenCV, geometry, and image processing techniques.	<ul style="list-style-type: none"> To develop an image processing algorithm capable of determining mango size using OpenCV, NumPy, and imutils. To classify mangoes based on size into small, medium, and large based on measurements.

Continued on next page

TABLE 1.1 EXPECTED DELIVERABLES PER OBJECTIVE

Objectives	Expected Deliverables
SO7: To classify mango bruises based on image data by employing machine learning algorithms.	<ul style="list-style-type: none"> • To train a machine learning model such as CNN capable of distinguishing bruised and non-bruised mangoes. • To train a machine learning model such as kNN, k-means, and Naïve Bayes capable of assessing the extent of bruising on the mangoes if it is significant or partial. • To gather a dataset of annotated images based on bruises. • To obtain an evaluation report of performance metrics of both CNN and other machine learning models.

1.5 Significance of the Study

Automating the process of sorting and grading mangoes increases efficiency and productivity for the user which would in effect remove human error in sorting and grading and decrease the human labor and time taken to sort and grade the mangoes. This is especially important for farmers with a large amount of fruit such as mangoes and a lesser labor force. A recent study showed that their automated citrus sorter and grader using computer vision can reduce the human labor cost and time to sort and grade when comparing the automated citrus sorter and grader to manual human labor ?.

Another benefit to automating sorting and grading mangoes is the improvement in quality control. This implies that compared to human labor, automating sorting and grading mangoes can uniformly assess the quality of mangoes based on size, color, and bruises, ensuring that the expected grade and high-quality mangoes reach the consumer. By accurately identifying substandard mangoes, the system helps in reducing waste and

383 ensuring that only marketable fruits are processed further.

384 Likewise, the scalability of automating sorting and grading mangoes is simpler, es-
385 pecially for lower labor force farmers with large volumes of mangoes. Because of the
386 possibility of large-scale operations by automating sorting and grading mangoes, farmers
387 can now handle large volumes of mangoes, making them suitable for commercial farms
388 and processing plants. Moreover, it can be adapted to different varieties of mangoes and
389 potentially other fruits with minor modifications.

390 **1.5.1 Technical Benefit**

- 391 1. The development of an automated Carabao mango sorter would increase the quality
392 control of classifying Carabao mango based on ripeness, size, and bruising.
- 393 2. The accuracy in sorting Carabao mangoes will be significantly improved while
394 reducing the errors due to human factors in manual sorting.
- 395 3. The automated Carabao mango sorter carefully sorts the mangoes while ensuring
396 that they remain free from bruising or further damage during the process

397 **1.5.2 Social Impact**

- 398 1. The reduction in manual labor creates opportunities in maintenance and technologies
399 in the automated Carabao mango sorter.
- 400 2. The automated Carabao mango sorter system improves Carabao mango standards
401 and enhances the satisfaction of the buyers and the customers through guaranteeing
402 consistent Carabao mango grade.

- 403 3. Opportunity to increase sales and profit for the farmers through consistent quality
404 and grade Carabao mangoes while reducing the physical labor to sort it.

405 **1.5.3 Environmental Welfare**

- 406 1. With the utilization of non-destruction methods of classifying Carabao mangoes
407 together with an accurate sorting system, overall waste from Carabao mangoes is
408 reduced and the likelihood of improperly sorted mangoes is decreased.
409 2. Automation of sorting and grading Carabao mangoes promotes sustainable farming
410 practices.

411 **1.6 Assumptions, Scope, and Delimitations**

412 **1.6.1 Assumptions**

- 413 1. The Carabao mangoes are from the same source together with the same variation
414 2. The Carabao mangoes do not have any fruit borer and diseases
415 3. All the components do not have any form of defects
416 4. The prototype would have access to constant electricity/power source.
417 5. The Carabao mangoes to be tested would be in the post-harvesting stage and in the
418 grading stage.
419 6. The image-capturing system would only capture the two sides of the mango which
420 are the two largest surface areas of the skin.

421 **1.6.2 Scope**

- 422 1. The prototype would be specifically designed to grade and sort Carabao Mangoes
423 based on only ripeness, size, and visible skin bruises.
- 424 2. The mangoes used as the subject will be solely sourced from markets in the Philip-
425 pines.
- 426 3. The Carabao mangoes would be graded into three levels.
- 427 4. The prototype will be using a microcontroller-based system locally stored on the
428 device itself to handle user interaction.
- 429 5. Computer vision algorithms to be used will include image classification.

430 **1.6.3 Delimitations**

- 431 1. The project would only be able to perform sorting and grading on one specific fruit
432 which is the Carabao mango and will not be able to sort other types of mangoes.
- 433 2. Additionally, the project prototype will only be able to capture, sort, and grade one
434 mango subject at a time which means the mangoes have to be placed in the conveyor
435 belt in a single file line for accurate sorting.
- 436 3. For the bruises, the system will only be able to detect external bruises and may not
437 identify the non-visible and internal bruises.
- 438 4. The system does not load the mangoes onto the conveyor belt itself. Assistance is
439 required to put mangoes into the conveyor belt to start the sorting process

- 440 5. The prototype will be powered using Alternating Current (AC) power and will be
441 plugged into a wall socket which is only suitable for indoor use.

442 **1.7 Overview of the Thesis**

443 There are seven succeeding chapters. To recall, chapter 1 involves the introduction of
444 the thesis topic containing the background of the study, previous studies, objectives and
445 deliverables, assumptions, scope, and delimitation, significance of the study, description
446 of the project together with the methodology, and Gantt chart and budget. Chapter 2
447 involves the existing articles, the lacking in their approaches, and the summary of chapter 2.
448 Chapter 3 involves the theoretical considerations of the thesis topic while chapter 4 would
449 consist of the design consideration involving the thesis topic. Chapter 5 would involve the
450 research methodology containing the testing procedure and setup. Chapter 6 would involve
451 the results and discussion based on the methodology while Chapter 7 would involve the
452 conclusion, recommendations, and future suggestions.

454

LITERATURE REVIEW

455 **2.1 Existing Work**

456 The research paper written by ? developed a ripeness grader for Carabao mangoes. The
457 Carabao mango ripeness grade calculated based on object and color detection which were
458 written in microcontroller. These are the systems designed by the researchers that consists
459 of Raspberry Pi 4, Arduino Uno, camera, touch screen LCD, MQ3 gas sensor, ventilation
460 system. The proposed system was able to ascertain an overall reliability of 95%: therefore,
461 the specified objective of ascertaining the ripeness level of the mangoes was met with
462 success. However, accuracy and reliability of the software system are there since the
463 hardware design does not seem to be workable when one must deal with the scores of
464 mangoes (?). In addition, the design of the hardware does not integrate any form of physical
465 automating, say like the conveyor belt. Besides, the hardware system only works efficiently
466 when deciding the ripeness grade of mangoes separately.

467 A study done by ? is another research paper that supports and has relevant information
468 concerning the topic. The researchers proposed a fully-perovskite photonic system which
469 has the capability to identify and sort or grade mango based on features such as color,
470 weight and, conversely, signs of damages (?). Some of the techniques in image processing
471 that the researchers used included image enhancement, image deblurring, edge detection
472 using MATLAB and Arduino as well as color image segmentation. By carrying out the
473 multiple trials on the device they achieved a classification speed of 8.132 seconds and an
474 accuracy of 91.2%. The proponents' metrics used for the ratings were speed wherein the
475 results were rated “excellent” while the accuracy rating given was “good”. One of the
476 limitations of the paper is that the researchers were only limited to the color, texture, and
477 size of the Carabao mango

478 Furthermore, the research paper presented by ? designed an Automated Carabao
479 mango classifier, in which the mango image database is used to extract the features like
480 weight, size, area along with the ratio of the spots for grading using Naïve Bayes Model.
481 Concerning the quantitative test design, one had to control and experiment with various
482 methods of image processing that would improve the likelihood of improved classification.
483 The paper methodology entailed sample collection from 300 Carabao mangoes, picture
484 taking using a DSLR camera, and feature deconstruction for categorization (?). The
485 system prototype and the software were designed with the programming language C# with
486 integration of Aforge. NET routines. The performance of this model was checked with
487 the help of the dataset containing 250 images, precision, recall, F-score key indicators
488 were used. The investigation discovered that the Naïve Bayes' model recognized large and
489 rejected mangoes with 95% accuracy and the large and small/medium difference with a
490 7% error, suggesting an application for quality differentiation and sorting in the mango
491 business industry. The limitations in the researchers' paper include the researchers were
492 able to achieve high accuracy after using a high quality DSLR camera and the fact that the
493 researchers were not able to incorporate the use of microcontrollers.

494 Another study by ? proposed SVM-based system for classifying the maturity stages of
495 bananas, mangoes, and calamansi. With the use of 1729 images of bananas together with
496 711 mango images and 589 calamansi, the researchers were able to achieve a high accuracy
497 score of above 90% for all fruits. Some pre-processing techniques used to get this high
498 accuracy are the change in hue, saturation, and value channels in the mango image (?). To
499 better understand the harvest time of mangoes, the paper by ? examined the association of
500 the harvest season with seasonal heat units, rainfall, and physical fruit attributes for Haden,
501 Kent, Palmer, and Keitt mango varieties to establish export and domestic market maturity

De La Salle University

502 standards. For the results of the paper, it shows that temperature, rainfall, and physical
 503 characteristics have a reliable, non-destructive indicators for determining mango maturity
 504 (?). This shows that physical characteristics and temperature are important when exporting
 505 fruits such as mangoes.

TABLE 2.1 COMPARISON OF EXISTING STUDIES

Existing Study	Limitations	Accuracy Rating
?	No physical automation, not suitable for large amounts of mangoes, only classifies ripeness and only a sample size of 10 mangoes.	95%
?	Focuses only on color and size.	91.2%
?	Relies on high-quality DSLR cameras, and limited automation due to not integrating microcontrollers.	95%
?	No physical automation implemented. Ripeness, size, and shape-based classification achieved 100%, 98.19%, and 99.20% accuracy respectively on their own. However, errors occurred when taking into account all these aspects together for grading mangoes, causing an accuracy rating deduction.	88.88%

506 Previous studies on mango grading have achieved an accuracy rating of up to 95%, as
 507 shown in Table 2.1. However, these studies either relied on a small sample size, which
 508 limits statistical significance, or utilized expensive equipment, which may be impractical.
 509 In light of this, the researchers have set a target accuracy rating of greater than or equal
 510 to 90%. This target ensures that the system being developed is comparable to, or better
 511 than, existing studies that used larger sample sizes or assessed multiple mango traits at the
 512 same time. Furthermore, this research aims to distinguish itself by not only maintaining or
 513 exceeding the 90% accuracy rating but also incorporating a graphical user interface (GUI)

514 for selective priority-based mango classification. The system will integrate both software
515 and hardware components, and it will evaluate a greater number of mango traits for grading
516 purposes.

517 **2.1.1 Sorting Algorithms**

518 In previous studies, researchers have implemented various artificial intelligence algorithms
519 in order to determine the optimal and most effective method for sorting mangoes. One of
520 the algorithms that was used in the classification of mangoes was the CNN or Convolutional
521 Neural Networks. A study done by ? explored the effectiveness of CNN, specifically in
522 classifying mangoes through image processing. The system that the researchers developed
523 graded mangoes into four groups which was based on the Chinese National Standard (?).
524 These mangoes were examined by their shape, color uniformity, and external defects. The
525 system that was developed had an impressive accuracy of 97.37% in correctly classifying
526 the mangoes into these grading categories Support Vector Machine was also one of the
527 classification algorithms that was implemented to detect flaws in mangoes. In that study by
528 ?, SVM was used in the classification of diseases from mangoes. The study used 4 different
529 diseases/defects for testing (?). The diseases were Anthracnose, Powdery Mildew, Black
530 Banded, and Red Rust. and provided 90% accuracy for both the leaves and the fruit

531 In the study done by ?, Simple Linear Regression, Multiple Linear Regression, and
532 Artificial Neural Network models were all studied and compared for the purpose of size-
533 mass estimation for mango fruits. The researchers found that the Artificial Neural Network
534 yielded a high accuracy rating for mass estimation and for mango classification based on
535 size with a success rate of 96.7% (?). This is attributed to the Artificial Neural Network
536 model's ability to learn both linear and nonlinear relationships between the inputs and the

537 outputs. However, a problem can occur with the use of the model, which is overfitting.
538 This issue occurs when the model is overtrained with the data set such that it will start to
539 recognize unnecessary details such as image noise which results in poor generalization
540 when fed with new data. With this in mind, additional steps will be necessary to mitigate the
541 issue. Another research article written by ? implements a method for sorting and grading
542 Carabao mangoes. This research focuses on the use of Probabilistic Neural Network, which
543 is another algorithm that is used for pattern recognition and classification of objects. For
544 this study, the researchers focused on the area, color, and the black spots of the mango
545 for their Probabilistic Neural Network model (?). Their research using the model yielded
546 an accuracy rating of 87.5% for classification of the mangoes which means it is quite
547 accurate for classifying mangoes within the predefined categories. However, problems
548 were encountered with the use of the model when trying to identify mangoes that did not
549 fit the predefined size categories of small, medium, and large. This means that the PNN
550 model may become challenged when presented with a mango with outlying traits or traits
551 that were very different from the data set.

552 **2.2 Lacking in the Approaches**

553 The majority of past researchers such as ? and ? were able to implement a fruit and
554 mango sorter together with an accurate AI algorithm to detect the ripeness defects. This
555 means that none of the previous research papers were able to integrate an interchangeable
556 user-priority-based grading together with size, ripeness, and bruises using machine learning
557 for Carabao mango sorter and grader. Our research however would implement an automated
558 Carabao mango sorter in terms of size, ripeness, and bruises with its own UI, conveyor

TABLE 2.2 COMPARISON OF SORTING ALGORITHM MODELS

Sorting Algorithm Model	Accuracy Rating	Criteria	Problems Encountered
Convolution Neural Network	97.37%	shape, color, defects	Minor blemishes affected the accuracy.
Support Vector Machine	90%	mango defects and diseases	The model is sensitive to noise, which requires intensive image preprocessing.
Artificial Neural Network	96.7%	for mango size and mass	Overfitting
Probabilistic Neural Network	87.5%	for mango area, color, and black spots	Difficulty in identifying mangoes that have outlying features or did not fit the predefined categories

559 belt, stepper motors, and bins for collecting the different ripeness and defect grade of the
 560 Carabao mango.

561 2.3 Summary

562 To reiterate, there is an innovative gap that needs to be filled with regards to the process of
 563 sorting and grading Carabao mangoes. The traditional methods for conducting this process
 564 manually by hand, by a porous ruler, by a sugar meter, and by a color palette can be prone
 565 to human error and expensive costs due to the number of laborers required to do the task.
 566 On the other hand, although researchers have already taken steps to automate the process
 567 of mango sorting and grading, there is still a need for an implementation that takes into
 568 account size, ripeness, and bruises altogether whilst being non-destructive and having its
 569 own embedded system. The research articles shown above show the different computer

De La Salle University

570 vision and CNN approaches for sorting and classifying mangoes. For example, a system
571 created by ? was more focused on ripeness detection. ? considered photonic systems
572 for grading mango fruit based on color and weight. On the other hand, ? implemented
573 the Naïve Bayes classification model on mangoes with high accuracy, which thereby did
574 not include any microcontroller. There was an attempt to study each of those parameters
575 separately and that is why the multifactorial approach was not used. With this in mind, the
576 system being proposed does exactly what was mentioned, to implement a non-destructive
577 and automated sorting and grading system for Carabao mangoes that takes into account
578 size, ripeness, and bruises altogether using machine learning, as well as having its own
579 embedded system. This system will be mainly composed of a conveyor belt, servo motors,
580 a camera, microcontrollers, and an LCD display for the user interface. By doing so, the
581 system should be able to improve the efficiency and productivity of mango sorting and
582 grading, remove the effect of human error and reduce time consumption. The studies also
583 provided critical insights regarding the effective algorithms that can be used in classification
584 stages in image processing. The use of CNN had the most accuracy with manageable
585 potential challenges. Lastly, by scaling the implementation, the overall export quality of
586 the Carabao mangoes can be improved.

587

Chapter 3

588

THEORETICAL CONSIDERATIONS

589 3.1 Introduction

590 Likewise, the purpose of this chapter is to go through the important theories in developing
 591 the prototype together with training and testing the machine learning model.

592 3.2 Relevant Theories and Models

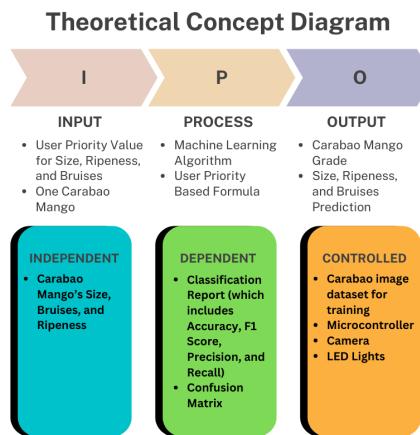

Fig. 3.1 Theoretical Framework Diagram.

593 The theoretical framework seen in figure 3.1 follows the IPO (Input-Process-Output)
 594 Model for a Carabao Mango Sorting System. The Input section includes user-defined
 595 priority values for size, ripeness, and bruises, along with a single mango for analysis. The
 596 Process section highlights the use of a machine learning algorithm and a user-priority-based
 597 formula to classify the mango. The Output consists of the mango's grade, predicted size,
 598 ripeness, and bruises. Below the IPO model, the diagram categorizes variables into three
 599 groups: Independent (mango's size, ripeness, and bruises), Dependent (classification report
 600 with accuracy, precision, recall, and confusion matrix), and Controlled (image dataset,
 601 microcontroller, camera, and LED lights).

3.3 Technical Background

At its core, the system will be using machine learning concepts pertaining to CNN and OpenCV, and may use other algorithms such as Naive Bayes and k-Nearest Neighbors to supplement the classification tasks, particularly for assessing mango ripeness, bruise detection, and size determination. The system will be built on an embedded framework, integrating a Raspberry Pi microcontroller to control the RaspberryPi camera, actuators, LED lights, and motors. A user-friendly GUI will also be utilized to ensure users can customize the prioritization of the mango sorting system.

3.4 Conceptual Framework Background

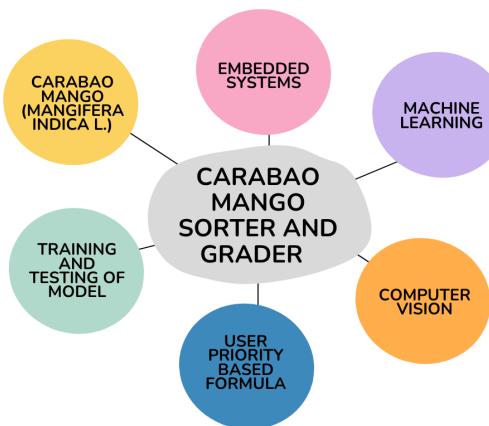

Fig. 3.2 Conceptual Framework Diagram.

The conceptual framework seen in figure 3.2 illustrates the key components involved in the Carabao Mango Sorter and Grader system. At the center, the system is represented as the core element, surrounded by six interconnected components: Carabao Mango (Mangifera indica L.), Embedded Systems, Machine Learning, Computer Vision, User

615 Priority-Based Formula, and Training and Testing of the Model. These elements represent
616 the different technologies, methodologies, and considerations required for the development
617 and operation of the sorter and grader. The diagram provides an overview of how various
618 disciplines contribute to the project's functionality.

619 **3.5 Software Concepts**

620 **3.5.1 Thresholding**

621 Thresholding is a computer vision image segmentation technique that is used to separate
622 objects from their surroundings by converting a grayscale image to binary. The conversion
623 is done by choosing a certain threshold intensity value. It is usually done by assigning pixels
624 with an intensity higher than the threshold are mapped to one value (commonly white),
625 and pixels with an intensity lower than the threshold are mapped to another (commonly
626 black). The result of this technique is in a high-contrast image that makes it easy to detect
627 the object's boundary and shape in the image.

628

629 In this project, two types of thresholding were applied:

- 630 • Absolute Difference Thresholding – This method involves computing the absolute
631 difference between two images. The first image is one of the object, and the other
632 of the same background without the object. The result isolates only the pixels that
633 have changed between the two images, thus isolating the mango from its background
634 successfully.
- 635 • Binary Thresholding – Once the difference image has been created, binary threshold-

636 ing is used. A threshold value is employed to threshold the difference image into a
 637 binary image. Values greater than the threshold are made white (foreground), and
 638 values less than that are made black (background). This creates a clear silhouette of
 639 the mango, which is appropriate for size estimation and contour detection.

640 **3.5.2 Object Size Calculation**

641 Object size calculation is the calculation of a certain object's true size from image data. This
 642 is essential in computer vision systems to efficiently process object features in real-time.
 643 In this research, the size of the Carabao mango is estimated through image measurement
 644 techniques based on geometric principles and camera calibration.

645 The size of the mango can be determined given:

$$\text{Real World Dimension} = \frac{\text{Pixel Dimension} \times \text{Distance from Camera to Object}}{\text{Focal Length}} \quad (3.1)$$

$$D(p, d, f) = \frac{p \cdot d}{f} \quad (3.2)$$

646 where $D(p, d, f)$ is the real world dimension of the object, p is the pixel dimension of
 647 the object, d is the distance from the camera to the object, and f is the focal length of the
 648 camera.

649 After capture and preprocessing of the image, the binary image so obtained is processed
 650 with contour detection to find the largest object, which is assumed to be the mango. The
 651 contour is then bounded with a minimum-area bounding box, and pixel-based length and
 652 width are calculated using Euclidean distance between the corner points.

653 This size estimation method offers a consistent and efficient way of taking the measurements with only standard camera input, providing consistency in classification and
654 reducing the necessity for physical measuring devices.
655

656 **3.5.3 Convolutional Neural Network**

657 Convolutional Neural Networks are a class of deep learning models commonly used in
658 analyzing visual data. CNNs are particularly effective in image classification tasks due to
659 their ability to automatically extract and effectively learn the spatial hierarchies of features
660 directly from the pixels of a given image. This makes it highly suitable for functions such
661 as object detection and, in the case of this study, image classification.

662 CNN usually applies filters to input images. These filters are designed to detect local
663 patterns such as edges, textures, and color gradients. The network is able to learn more
664 patterns as the data goes through the layers. This enables it to recognize effectively the
665 characteristics that it is looking for.

666 The use of CNNs in this study allows for accurate, automated classification of mango
667 images which contributes to the development of a reliable, non-destructive grading system
668 that minimizes human error and ensures consistent quality assessment

669 **3.6 Hardware Concepts**

670 **3.6.1 Camera Module**

671 The camera module serves as the main image acquisition tool in the mango sorter and
672 grader system. Its role is to capture clear, high-resolution images of each mango as it moves

673 along the conveyor. These images are critical for analyzing physical traits like ripeness,
674 bruising, and size through computer vision and machine learning techniques.

675 The camera is directly connected to the Raspberry Pi, which manages both image
676 capture and processing. It is fixed in position to ensure consistent distance and angle for
677 all images. It is also paired with a lighting system to provide a consistent lighting for the
678 images. The system captures images of both the top and bottom sides of each mango to
679 ensure a more accurate grading. The prototype integrates the Raspberry Pi Camera Module
680 Version 2. This camera is chosen for its 8MP resolution which is critical in capturing
681 real-time images. Another reason for integrating this camera is because of its compatibility
682 with the Raspberry Pi 4, and reliability in capturing detailed images needed for accurate
683 classification. It is also cost effective and lightweight which is important for the prototype.

684 **3.6.2 4 Channel Relay**

685 The relay module in this project is used to control the direction and movement of the
686 motors that operate the conveyor system and mango sorting mechanism. As an electrically
687 operated switch, the relay allows the low-power signals from the Raspberry Pi to safely
688 manage the higher voltage and current required by the DC motors.

689 For the prototype, the relay module is responsible for changing the polarity of motor
690 connections which enables the motors to rotate in both forward and reverse directions.
691 This will drive the conveyor belt system. This is essential for moving mangoes along the
692 conveyor, rotating them for the top and bottom image capture, and directing them to the
693 appropriate bin based on their grade.

694 **3.6.3 Gear Ratio**

695 In this prototype, gear ratios are used to control the rotational speed of the conveyor belts
696 that move and rotate the mango. A gear ratio of 1:3 was applied, meaning the motor gear
697 completes one full rotation for every three rotations of the driven gear. This is also done in
698 order to avoid overspeeding and make sure that the conveyor belt moves in a controlled
699 manner. This setup slows down one belt relative to the other, creating a differential speed
700 between the left and right belts. As a result, the mango rotates in place while being moved
701 forward. This rotation is essential for capturing both the top and bottom views of the mango
702 for accurate classification and grading.

703 **3.7 Summary**

704 Overall, chapter 3 establishes key concepts and theoretical considerations that form the
705 foundation of the Carabao mango sorter and grading system. It discusses and connects
706 each component together, explaining how each component such as the RaspberryPi and
707 DC motors work together to create a system that utilizes machine learning and computer
708 vision techniques to classify mangoes based on user priority.

709

Chapter 4

710

DESIGN CONSIDERATIONS

711 Likewise, the objective of chapter 4 is to describe the researcher's design consideration
712 when developing and testing the prototype. For an overview of the design of the prototype,
713 the researchers considered different computer vision models in classifying the ripeness
714 and bruises together with other algorithms to determine the size of the mango. Likewise,
715 the hardware design was also taken into consideration where the physical design of the
716 conveyor belt was taken into account.

717 **4.1 Introduction**

718 This chapter discusses the design considerations for the mango sorting and grading system,
719 focusing on the technical and engineering decisions required for its development. The
720 design process aims to create a scalable, efficient, and user-friendly system that leverages
721 machine learning for accurate mango classification.

722 **4.2 System Architecture**

723 The system architecture is represented through a block diagram, showcasing modules
724 such as image acquisition, preprocessing, feature extraction, machine learning model, and
725 grading output. Each module is described in detail, emphasizing its role in the overall
726 system. For instance, the image acquisition module uses high-resolution cameras to capture
727 mango images, while the preprocessing module enhances image quality for better feature
728 extraction.

729 In figure 4.1 presents the electronic circuit diagram, designed using Proteus. The
730 diagram illustrates a system where a Raspberry Pi 4 serves as the central control unit,

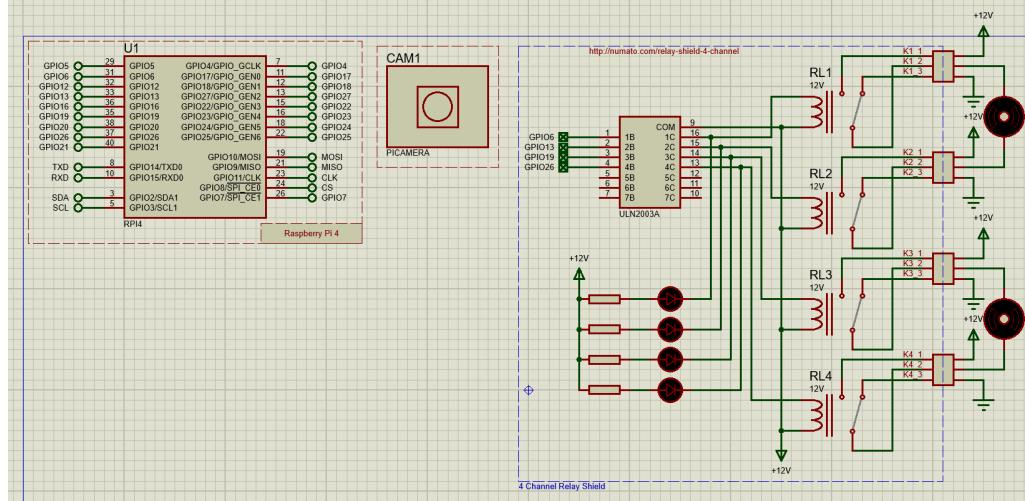

Fig. 4.1 Hardware Schematic

731 managing four motors through a relay mechanism. The Raspberry Pi 4, represented by
 732 a rectangular box on the left, showcases various pin connections, including GPIO pins,
 733 power supply pins (5V and 3V3), ground pins (GND), and communication pins (TXD,
 734 RXD, SDA, SCL).

735 In the center of the diagram, an 18-pin integrated circuit labeled "ULN2803A" is
 736 depicted. This component, a Darlington transistor array, likely functions as a buffer,
 737 providing the necessary current to drive the relays. Four relays, designated as RL1, RL2,
 738 RL3, and RL4, are positioned on the right side of the diagram, each connected to a motor
 739 (represented by a circle with an "M" inside) and a +12V power source. Additionally, four
 740 resistors are placed between the ULN2803A and the relays, serving to limit current. The
 741 circuit section containing these resistors is labeled "4 Channel Relay Driver," indicating its
 742 purpose.

743 The camera module is labeled "PICAMERA" is located in the top center of the diagram.
 744 It is represented by a square with a circle inside, symbolizing the camera lens. The camera

745 module is connected to the Raspberry Pi 4 through the CSI (Camera Serial Interface) pins.
 746 The overall circuit is designed for a 12V system, with the +12V power supply indicated at
 747 various points. The Raspberry Pi 4's GPIO pins are used to control the relays.

748 4.3 Hardware Considerations

749 The hardware components include high-resolution cameras, lighting systems for consistent
 750 image capture, and microcontrollers like Raspberry Pi or Arduino for system control,
 751 actuators like DC and stepper motors to move the mangoes. The choice of hardware is
 752 justified based on cost, performance, and compatibility with the software framework.

753 4.3.1 General Prototype Framework

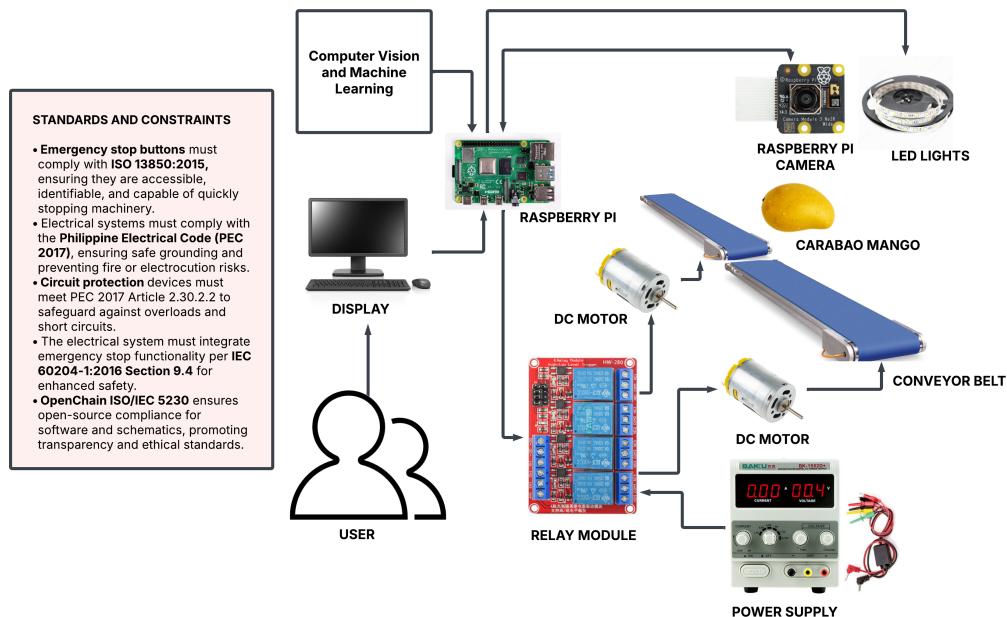

Fig. 4.2 Prototype Framework

754 The Figure 4.2 presents the overall prototype layout of the automated Carabao mango
755 sorter and grader. The diagram illustrates the flow of operations from mango loading onto
756 the conveyor belt to sorting them. It illustrates the major elements of the system, that is,
757 the image acquisition area, lighting system, camera module, Raspberry Pi controller, and
758 mechanical actuators. The layout illustrates how all the subsystems work together to ensure
759 mangoes are scanned, processed, sorted based on ripeness, size, and bruises, and eventually
760 sorted based on the calculated priority score. The layout served as the basis for actual
761 prototype development.

762 **4.3.2 Prototype Flowchart**

763 The flowchart in Figure 4.3 represents the overall operational logic of the mango grading
764 and sorting system. The process starts with system initialization, where the camera and
765 lighting modules are switched on and the machine learning algorithms are initialised. The
766 input of the user priority values as well as the detection of the mango on the conveyor
767 belt triggers the capture of both the top and bottom cheek of the mango. The captured
768 image is processed using machine learning algorithms to determine its ripeness, size, and
769 bruises. Depending on these classifications along with priority weights given by the user,
770 the system calculates an overall score. Once this calculation is done, the mango is routed to
771 the respective bin through the respective actuator. Having this logical sequence is important
772 to know the system's decision-making and automation process.

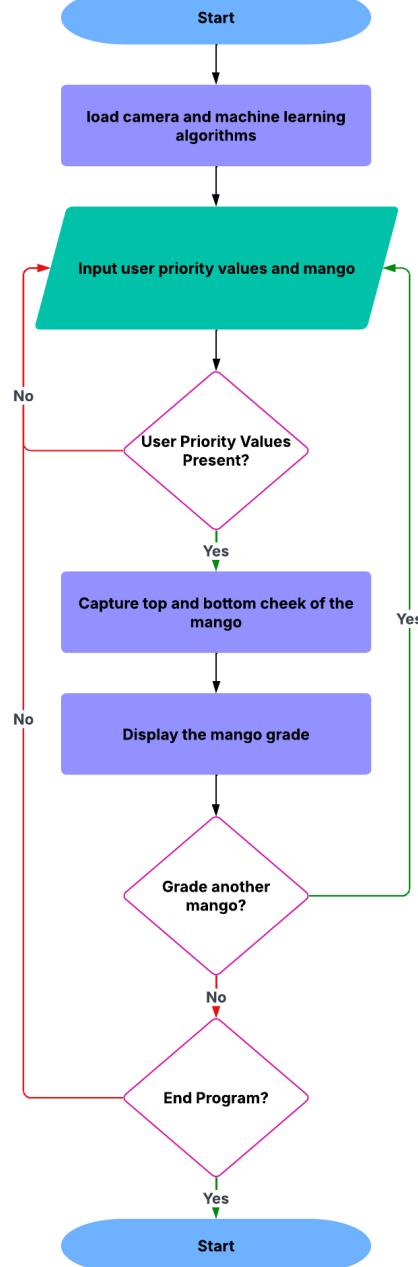

Fig. 4.3 Prototype Main Flowchart

De La Salle University

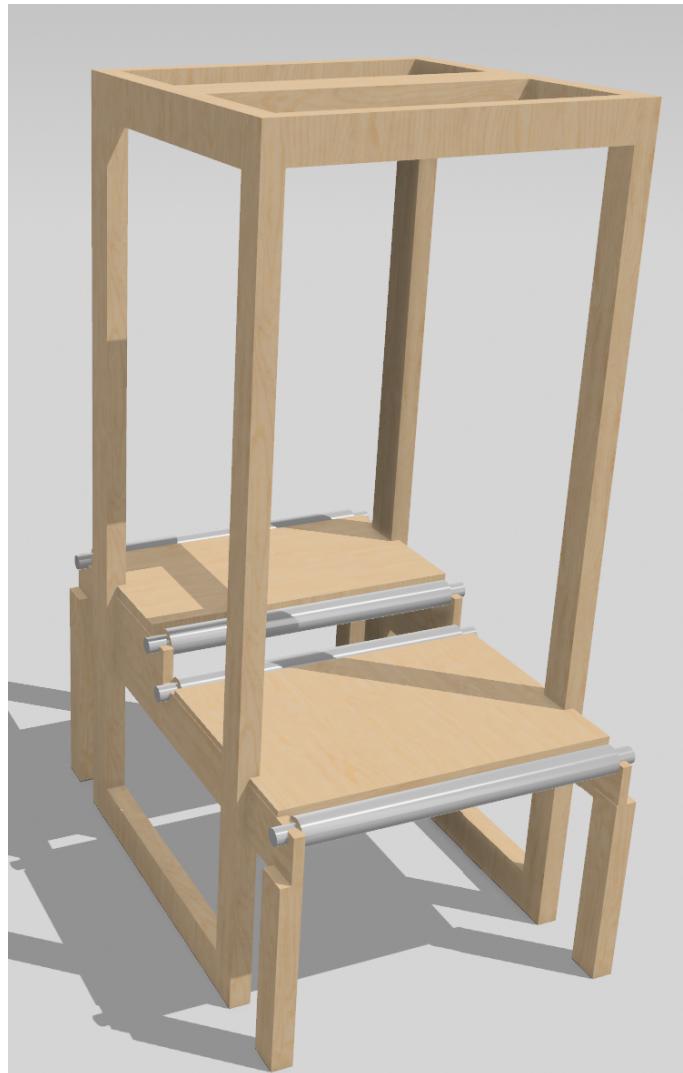

Fig. 4.4 Initial 3D Model of the Prototype

773 4.3.3 Prototype 3D Model

774 Figure 4.4 shows the first 3D model of the initial physical prototype developed for the
775 sorting and grading system. This model shows the skeleton of the system and where
776 the conveyor system is going to be placed strategically in order to flip the mango for
777 image acquisition. It is useful for where the hardware components would be arranged
778 and assembled. This 3D model helped the researchers visualize the spacing, alignment,
779 and where to mount parts before assembling the prototype making sure all electronic and
780 mechanical components are effectively integrated.

781 4.3.4 Hardware Specifications

782 4.3.4.1 Raspberry Pi

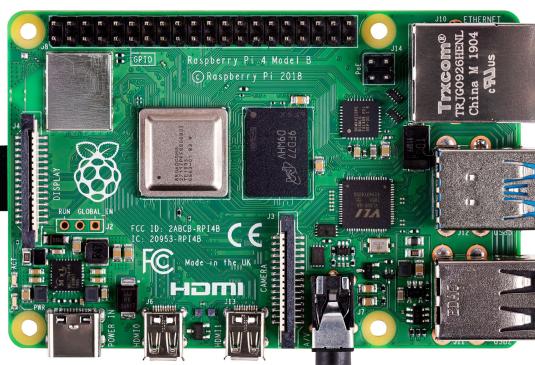

Fig. 4.5 Raspberry Pi 4 Model B

783 Figure 4.5 depicts the Raspberry Pi 4 Model B which is the core of the processing unit

784 of the prototype. It was selected due to its small size, low cost, and high computing power
785 for image processing and machine learning. The image depicts the most critical aspects
786 of the board, such as the GPIO (General Purpose Input/Output) pins for sensor, actuator,
787 and relay connections, and the USB and HDMI ports for other device connections. Its
788 capability to support a full operating system makes it suitable for supporting both the user
789 interface and the control logic of the mango grading system.

790 **Specifications:**

- 791 • SoC: Broadcom BCM2711
- 792 • CPU: Quad-core ARM Cortex-A72 (64-bit)
- 793 • Clock Speed: 1.5 GHz (base, overclockable)
- 794 • RAM: 8GB LPDDR4-3200 SDRAM
- 795 • Wireless: Dual-band 2.4 GHz / 5 GHz Wi-Fi (802.11ac)
- 796 • Bluetooth: Bluetooth 5.0 (BLE support)
- 797 • Ethernet: Gigabit Ethernet (full throughput)
- 798 • USB: 2 x USB 3.0 ports and 2 x USB 2.0 ports
- 799 • Video Output: 2 x micro-HDMI ports (supports 4K @ 60Hz, dual 4K display
800 capability)
- 801 • Audio: 3.5mm audio/video composite jack
- 802 • Storage: MicroSD card slot (supports booting via SD card or USB)

- 803 • GPIO: 40-pin GPIO header (backward-compatible with older models)
- 804 • Camera/Display: CSI (camera) and DSI (display) ports
- 805 • Power Input: USB-C (5V/3A recommended)
- 806 • Power Consumption: 3W idle, up to 7.5W under load

807 **4.3.4.2 Raspberry Pi Camera**

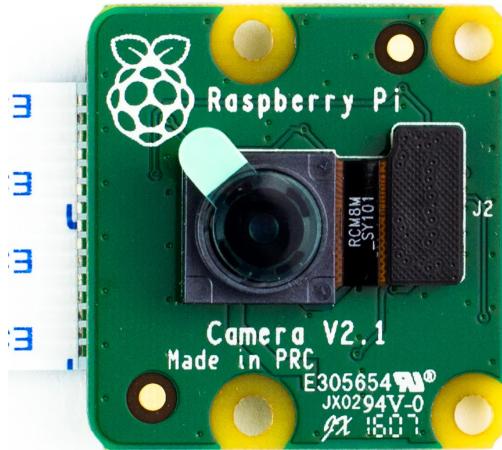

Fig. 4.6 Raspberry Pi Camera Module Version 2

808 The Raspberry Pi Camera Module Version 2 is a high-quality camera module designed
809 for the Raspberry Pi platform. Likewise, it is capable of capturing still images at 8 megapix-
810 els, and supports video recording at 1080p @ 30fps, 720p @ 60fps, and 480p @ 90fps.
811 Moreover, it has a fixed-focus lens with a diagonal field of view of 62.2 degrees, and
812 an optical format of 1/4 inch. Furthermore, it supports various Python libraries such as
813 Picamera and OpenCV for image capture and processing. As such, it was selected for its

De La Salle University

814 compact size, ease of integration, and ability to capture high-resolution images.

815

816 **Specifications:**

817 • Sensor: Sony IMX219PQ 8-megapixel CMOS sensor.

818 • Still Images Resolution: 8 MP (3280 x 2464 pixels).

819 • Video Resolution: Supports up to 1080p @ 30fps, 720p @ 60fps, and 480p @ 90fps.

820 • Focus: Fixed-focus lens (manual focus adjustment not supported without physical
821 modification).

822 • Lens Size: 1/4-inch optical format.

823 • Field of View (FoV): Diagonal 62.2 degrees.

824 • Interface: Connected via 15-pin ribbon cable to the Raspberry Pi's CSI (Camera
825 Serial Interface) port.

826 • APIs/Libraries: Supports Python libraries such as Picamera and OpenCV for image
827 capture and processing.

828 • Dimensions: 25 mm x 24 mm x 9 mm.

829 **4.3.4.3 DC Motor**

830 The 12 Volt DC Gear Motor is a compact, high-torque, and low-noise motor suitable for a
831 wide range of applications, including robotics, automation, and industrial control systems.

832 It features a spur gear design, which provides a high reduction ratio for increased torque
833 output. The motor is designed for continuous operation and has a low power consumption

Fig. 4.7 12 Volt DC Gear Motor

under standard load conditions. Likewise, it is also capable of withstanding high temperatures and has a high reliability. This motor was selected for its high torque output, low power consumption, and compact size, making it ideal for the conveyor system.

Specifications:

- Gearbox Type: Spur gear design
- Operating Voltage: 12V (operational range: 6-12V)
- No-load Current Consumption: 0.8A
- Rated Current Draw: 3A (under standard load)
- No-load Speed: 282 RPM (maximum)
- Operating Speed: 248 RPM (under rated load)

- 845 • Torque Output: 18 kg-cm (rated)
- 846 • Stall Torque: 60 kg-cm (maximum)
- 847 • Power Rating: 50W (maximum)
- 848 • Unit Weight: 350 grams

849 **4.3.4.4 MicroSD Card**

Fig. 4.8 SanDisk Ultra MicroSD Card

850 The SanDisk Ultra MicroSD Card is a compact, high-capacity, and secure digital
851 memory card that is suitable for a wide range of applications, including digital cameras,
852 smartphones, and tablets. It features a high-speed data transfer rate, making it ideal for
853 storing large files such as images and videos. This card was selected for its high capacity, se-
854 cure data protection, and ease of use, making it ideal for the storage system for the prototype.
855

856 **Specifications:**

- 857 • Capacity: 256GB
858 • Type: MicroSDXC (Secure Digital eXtended Capacity)
859 • Form Factor: MicroSD (11mm x 15mm x 1mm)
860 • File System: Pre-formatted exFAT

861 **4.3.4.5 LED Lights**

Fig. 4.9 LED Light Strip

862 For the Light Emitting Diode (LED), they were used to provide consistent lighting for
863 image capture, ensuring accurate color representation and feature extraction. The LED
864 lights were selected for their energy efficiency, long lifespan, and ability to produce a
865 uniform light output.

866

867 **Specifications:**

- 868 • Power Input: 5V DC (USB-powered, compatible with laptops, power banks, or USB
869 adapters).
- 870 • Waterproof Design: Suitable for indoor/outdoor use.
- 871 • LED Type: SMD 2835 (surface-mount diodes for high brightness and efficiency).
- 872 • Color Type: White (cool white)
- 873 • Length: 1m
- 874 • Beam Angle: 120°
- 875 • Operating Temperature: -25°C to 60°C.
- 876 • Storage Temperature: -40°C to 80°C.

877 **4.3.4.6 Power Supply**

878 The bench power supply is a versatile and adjustable power source used to provide stable
879 voltage and current for various electronic projects. It is designed for testing applications,
880 allowing users to set specific voltage and current levels. This power supply was selected
881 for its versatility, ease of use, and ability to provide accurate voltage and current control for
882 the prototype.

883

884 **Specifications:**

- 885 • Type: SMPS (Switch-Mode Power Supply)
- 886 • Input: 110V AC, 50/60Hz (U.S. Standard)

Fig. 4.10 Bench Power Supply

- 887 • Output Range: 0-30V DC / 0-5A DC
- 888 • Voltage Precision: $\pm 0.010\text{V}$ (10 mV) resolution
- 889 • Current Precision: $\pm 0.001\text{A}$ (1 mA) resolution
- 890 • Power Precision: $\pm 0.1\text{W}$ resolution
- 891 • Weight: 5 lbs (2.27 kg)
- 892 • Dimensions: 11.1" x 4.92" x 6.14" (28.2 cm x 12.5 cm x 15.6 cm)
- 893 • Maximum Power: 195W
- 894 • Power Source: AC input only

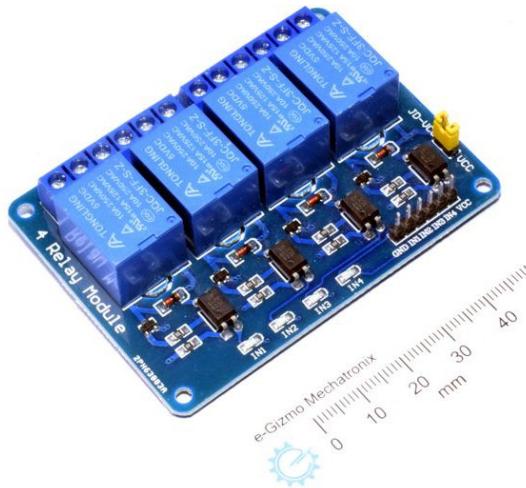

Fig. 4.11 4 Channel Relay Module

895 **4.3.4.7 4 Channel Relay Module**

896 The 4 Channel Relay Module is a compact and versatile relay board that allows for the
897 control of multiple devices using a single microcontroller. This module was selected for
898 its compact size, ease of use, and ability to control multiple devices simultaneously. It is
899 designed to be used with microcontrollers such as Arduino and Raspberry Pi, allowing for
900 easy integration into the prototype.

901

902 **Specifications:**

- 903 • Operating Voltage: 5V DC (compatible with Arduino, Raspberry Pi, and other
904 microcontrollers).
- 905 • Number of Relays: 4 independent channels.
- 906 • Relay Type: Electromechanical (mechanical switching).

- 907 • Max AC Load: 10A @ 250V AC (resistive).
- 908 • Max DC Load: 10A @ 30V DC (resistive).
- 909 • Contact Type: SPDT (Single Pole Double Throw) - NO (Normally Open), NC
910 (Normally Closed), COM (Common).
- 911 • Dimensions: 50mm x 70mm x 20mm
- 912 • Weight: 50-80 grams.
- 913 • Status LEDs: Individual LEDs for each relay (indicates ON/OFF state).
- 914 • Input Pins: 4 digital control pins (one per relay).
- 915 • Output Terminals: Screw terminals for connecting loads (NO/NC/COM).

916 **4.4 Software Considerations**

917 The software stack includes Python for programming PyTorch for machine learning and
918 OpenCV for image processing. These tools are selected for their robustness, ease of use,
919 and extensive community support, ensuring efficient system development.

920 **4.4.1 PyTorch**

921 PyTorch is an open-source deep-learning framework used in this project for implementing
922 and running the convolutional neural networks responsible for classifying mango ripeness
923 and detecting bruises. Its dynamic computational graph and GPU acceleration support
924 made it an ideal choice for real-time image classification. Its simplicity and flexibility also

925 allowed for easy integration with the Raspberry Pi which is important as it is the main
926 processing unit for the system.

927 **4.4.2 OpenCV**

928 Open Source Computer Vision Library or OpenCV is utilized in the system for all image
929 processing tasks, particularly in preprocessing steps such as background subtraction, thresh-
930 olding, edge detection, and contour analysis. These operations are essential for calculating
931 the real-world dimensions of the mango. OpenCV was utilized primarily because of its
932 diverse set of functions, performance optimization, and ease of use making it a core tool
933 for enabling accurate and fast computer vision processing within the prototype.

934 **4.4.3 CustomTkinter**

935 CustomTkinter is a modern alternative to the standard Tkinter library, and is used to
936 build the graphical user interface (GUI) of the system. It provides a more polished and
937 customizable visual appearance while retaining the simplicity of Tkinter. With features
938 such as styled buttons, frames, and labels, CustomTkinter allowed for the creation of
939 a user-friendly interface that supports real-time display of classification results, priority
940 scoring inputs, and system status updates.

941 **4.5 Security and Reliability Considerations**

942 Potential vulnerabilities, such as data corruption during image capture, are addressed
943 through redundancy and error-checking mechanisms. Reliability is ensured by implement-
944 ing fault-tolerant designs and rigorous testing protocols.

945 **4.6 Scalability and Efficiency Considerations**

946 The system is designed to handle large volumes of mangoes by optimizing the machine
947 learning model and using parallel processing techniques. Efficiency is improved through
948 techniques like model quantization and hardware acceleration.

949 **4.7 User Interface**

950 A User Interface (UI) is designed to display grading results, system status. Wireframes
951 illustrate the layout, ensuring usability and accessibility for operators. Likewise, a Graphical
952 User Interface (GUI) is also used to allow users to customize the system's grading priorities.

953 **4.8 Constraints and Limitations**

954 Challenges include variations in mango appearance due to lighting and environmental
955 factors. Trade-offs are made between model complexity and real-time performance to
956 balance accuracy and speed.

957 **4.9 Technical Standards**

958 The system adheres to industry standards for image processing and machine learning,
959 ensuring compatibility and interoperability with other systems.

4.10 Prototyping and Simulation

Prototypes are developed using tools like MATLAB and Simulink to simulate the system's performance. These simulations help identify design flaws and optimize the system before deployment.,

4.11 Design Validation

The design is validated through testing, including unit testing of individual modules and integration testing of the entire system. Peer reviews and iterative improvements ensure the system meets the desired performance metrics.

4.12 Summary

This chapter outlined the key design considerations, including system architecture, hardware and software choices, and validation methods. These decisions are critical for developing a reliable and efficient mango sorting and grading system.

974 5.1 Introduction

975 The methodology for this research outlines the development of the Carabao Mango sorter
976 using machine learning and computer vision. The sorting system uses a conveyor belt
977 system which delivers the mangoes into the image acquisition system. This system captures
978 the image of the mangoes which will then be going through the various stages of image
979 processing and classification into grades which will depend on the priority of the user.
980 This methodology ensures that the grading of the mangoes will be accurate while being
981 non-destructive.

982 5.2 Research Approach

983 This study applies the experimental approach for research in order to develop and properly
984 test the proposed system. The experimental approach of the methodology will allow the
985 researchers to fine-tune the parameters and other factors in the classification of mangoes in
986 order to get optimal results with high accuracy scores while maintaining the quality of the
987 mangoes. This approach will also allow for real-time data processing and classification
988 which will improve the previous static grading systems.

989 5.3 Hardware Design

990 The prototype consists of hardware and software components for automated mango sorting
991 and grading purposes. The hardware includes the conveyor belt system used to transfer
992 mangoes from scanning to sorting smoothly. A camera and lighting system are able
993 to collect high-resolution images for analysis. The DC motors and stepper motors are

994 responsible for driving the conveyor belt and sorting actuators. The entire system is
995 controlled by a microcontroller (Raspberry Pi 4b), coordinating actions of all components.
996 Sorting actuators then direct mangoes into selected bins based on their classification to
997 make sorting efficient.

998 **5.4 Software Design**

999 For the programming language used for the prototype and training and testing the CNN
1000 model, Python was used for training and testing the CNN model and it was also used in the
1001 microcontroller to run the application containing the UI and CNN model. PyTorch was the
1002 main library used in using the EfficientNet model that is used in classifying the ripeness
1003 and bruises of the mango. Likewise, tkinter is the used library when designing the UI in
1004 Python.

1005 Furthermore, the rest of the software components are of utmost importance to mango
1006 classification. Image processing algorithms in OpenCV and CNN models extract features
1007 such as color, size, and bruises that are known to determine quality parameters of mangoes.
1008 Mangoes are classified based on ripeness and defects by using machine learning algorithms,
1009 which further enhances accuracy using deep learning techniques. A user interface (UI) is
1010 designed for users to control and observe the system in real time. Finally, the interface
1011 programming of the microcontroller provides the necessary synchronization between
1012 sensors, actuators, and motors throughout the sorting operation scenario.

5.5 Data Collection Methods

For the data collection, online available image datasets with Carabao mangoes were used together with the captured Carabao mango images. For the setup of the captured Carabao mangoes, the height of the camera to the white flat surface is 26 cm which can be seen on Figure 5.1. Furthermore, the S24's camera is used for capturing both cheeks of the Carabao mango. Initially, the Carabao mangoes would be unripe and green and each day the Carabao mangoes would be pictured until they are ripe.

Fig. 5.1 Carabao Mango Image Data Collection

5.6 Testing and Evaluation Methods

In a bid to ensure the mango sorting and grading system is accurate and reliable, there is intensive testing conducted at different levels. Unit testing is initially conducted on each component separately, for instance, the conveyor belt, sensors, and cameras, to ensure that

1024 each of the components works as expected when operating separately. After component
 1025 testing on an individual basis, integration testing is conducted to ensure communication
 1026 between hardware and software is correct to ensure the image processing system, motors,
 1027 and sorting actuators work in concert as required. System testing is conducted to con-
 1028 duct overall system performance testing in real-world conditions to ensure mangoes are
 1029 accurately and efficiently sorted and graded.

1030 **5.6.1 Classification Report**

1031 **5.6.1.1 Confusion Matrix**

	Predicted Positive	Predicted Negative
Actual Positive	TP	FN
Actual Negative	FP	TN

TABLE 5.2 CONFUSION MATRIX EXAMPLE

1032 A confusion matrix is a table that visualizes the performance of a classification model.
 1033 For a binary classification problem, it has four components:

1034

- 1035 • True Positives (TP): Cases correctly predicted as positive
- 1036 • True Negatives (TN): Cases correctly predicted as negative
- 1037 • False Positives (FP): Cases incorrectly predicted as positive. (Type I error)
- 1038 • False Negatives (FN): Cases incorrectly predicted as negative (Type II error)

1039 **5.6.1.2 Precision**

$$\text{Precision} = \frac{TP}{TP + FP} \quad (5.1)$$

1040 Precision measures how many of the predicted positives are actually positive. It answers
 1041 the question: "When the model predicts the positive class, how often is it correct?" High
 1042 precision means low false positives.

1043 **5.6.1.3 Recall**

$$\text{Recall} = \frac{TP}{TP + FN} \quad (5.2)$$

1044 Recall, which is also called sensitivity, measures how many of the actual positives were
 1045 correctly identified. It answers the question: "Of all the actual positive cases, how many
 1046 did the model catch?" High recall means low false negatives.

1047 **5.6.1.4 F1 Score**

$$F_1 = 2 \times \frac{\text{Precision} \times \text{Recall}}{\text{Precision} + \text{Recall}} \quad (5.3)$$

1048 The F1 score is the harmonic mean of precision and recall. It provides a single metric
 1049 that balances both concerns. This is particularly useful when you need to find a balance
 1050 between precision and recall, as optimizing for one often decreases the other.

1051 **5.6.1.5 Accuracy**

$$\text{Accuracy} = \frac{TP + TN}{TP + TN + FP + FN} \quad (5.4)$$

1052 Accuracy measures the proportion of correct predictions (both true positives and true
1053 negatives) among the total cases. While intuitive, accuracy can be misleading with imbal-
1054 anced datasets.

1055 To test system performance, various measures of performance are used to evaluate.
1056 As seen on equation 5.4, accuracy score is used to measure the percentage of correctly
1057 classified mangoes to ensure the system maintains high precision levels. Precision as seen
1058 on equation 5.1 and recall as seen on equation 5.2 are used to measure consistency of
1059 classification to determine if the system classifies different ripeness levels and defects
1060 correctly. Furthermore, the F1 score formula as seen on equation 5.3 is used to evaluate the
1061 performance of the model's classification.

1062 A confusion matrix is used to measure correct and incorrect classification to ensure the
1063 machine learning model is optimized and that minimum errors are achieved. Throughput
1064 analysis is also used to determine the rate and efficiency of sorting to ensure that the
1065 system maintains high capacity without bottlenecks to sort mangoes. Using these methods
1066 of testing, the system is constantly optimized to ensure high-quality and reliable mango
1067 classification.

1068 **5.6.2 Ripeness Training and Testing**

1069 For the testing of the ripeness classification, the Carabao mangoes are classified into three
1070 ripeness stages which are Green, green yellow, and yellow. Likewise, The green would
1071 represent the ripe mangoes while the green yellow would represent the semi ripe while the
1072 yellow would represent the ripe mangoes. As reference, Figure 5.3 shows the different
1073 ripeness stages for Carabao/Pico mangoes.

Annex A

Stages of ripeness of 'carabao' and 'pico' mango fruits

Stage of ripeness	Peel color	Flesh color
Green	Completely light green	Yellowish white or light yellow green
Breaker	Traces of yellow	Middle area and fruit outline yellowish; other areas, white to yellowish white
Turning	More green than yellow	More yellow than white
Semi-ripe	More yellow than green	Yellow for 'carabao'; yellow orange for 'pico'
Ripe	80-100% yellow ('carabao') or yellow orange ('pico')	Middle area yellow for 'carabao'; yellow orange for 'pico'
Overripe	Yellow for 'carabao'; yellow orange for 'pico'	100% yellow for 'carabao' and yellow orange for 'pico'

Fig. 5.2 Carabao Mango Ripeness Stages

5.6.3 Bruises Training and Testing

For the testing of the bruise classification of the Carabao mangoes, it would classified into two categories which are bruised and not bruised. To define what bruise and not bruise mangoes looked like Figure 5.3 is used as reference to categorize which mangoes are bruised and not bruised.

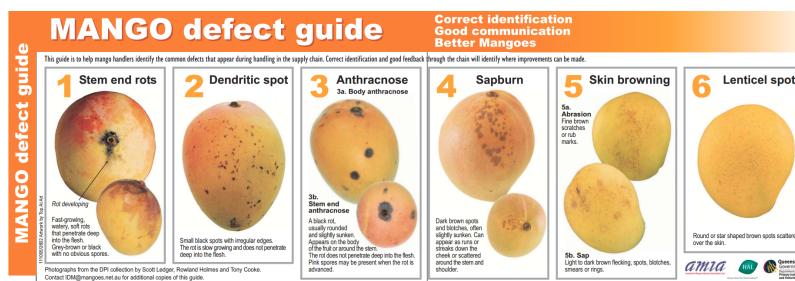

Fig. 5.3 Different Kinds of Mango Defects

1079 5.6.4 Size Determination

1080 To get the size of the mangoes, computer vision techniques such as Gaussian Blur and
 1081 Thresholding are used to get the length and width of the mangoes.

1082 5.7 Mango Formula with User Priority

1083 The linear equation used to calculate the Carabao mango grade is shown below. Likewise,
 1084 the variables $B(P)$, $R(P)$, and $S(P)$ represent the user-defined priority weightings for
 1085 bruising, ripeness, and size characteristics in the User Priority-Based Grading system.
 1086 Additionally, $b(p)$, $r(p)$, and $s(p)$ correspond to the machine learning model's predicted
 1087 values for the bruising, ripeness, and size attributes of the Carabao mango.

$$\text{Mango Grade} = b(P)B(P) + r(P)R(P) + s(P)S(P) \quad (5.5)$$

1088 The machine learning predictions are assigned the following numerical values:

1089 Ripeness Scores:

$$r(\text{yellow}) = 1.0 \quad (5.6)$$

$$r(\text{yellow-green}) = 2.0 \quad (5.7)$$

$$r(\text{green}) = 3.0 \quad (5.8)$$

1090 Bruises Scores:

$$b(\text{bruised}) = 1.0 \quad (5.9)$$

$$b(\text{unbruised}) = 2.0 \quad (5.10)$$

1091 **Size Scores:**

$$s(\text{small}) = 1.0 \quad (5.11)$$

$$s(\text{medium}) = 2.0 \quad (5.12)$$

$$s(\text{large}) = 3.0 \quad (5.13)$$

5.8 Ethical Considerations

Ethical considerations ensure that the system is operated safely and responsibly. Data privacy is ensured by securely storing and anonymizing extracted images and classification data so that unauthorized access becomes impossible. The system is also eco-friendly through non-destructive testing, saving mangoes while also ensuring that they are of good quality. Safety in operations is also ensured by protecting moving parts to prevent mechanical harm and incorporating fail-safes to securely stop operation in case of malfunction. Addressing these concerns, the system is not only accurate and efficient but also secure, eco-friendly, and safe for operators, thus a sustainable solution to automated mango sorting and grading.

5.9 Summary

This chapter explained how to create an automatic Carabao mango sorter and grader using machine learning and computer vision. The system integrates hardware and software resources, including a conveyor belt, cameras, sensors, and actuators, to offer accurate, real-time sorting by ripeness, size, and bruises. Various testing and evaluation processes ensure its performance to offer reliability. Ethical issues are data privacy, environmental

De La Salle University

1108 sustainability, and operation safety. With enhanced efficiency, reduced human error, and
1109 enhanced quality, this system provides an affordable, scalable, and non-destructive solution
1110 to post-harvest mango classification in agricultural industries.

6.3 Formula with User Priority

$B(P)$ and $R(P)$ and $S(P)$ are the User Priority-Based Grading for bruises, ripeness, and size of the Carabao mango. Furthermore, $b(p)$ and $r(p)$ and $s(p)$ are the machine learning's predictions for bruises, ripeness, and size of the Carabao mango. The formula for the user priority is given by:

$$\text{Mango Grade} = b(P)B(P) + r(P)R(P) + s(P)S(P) \quad (6.1)$$

The machine learning predictions are assigned the following numerical values:

Ripeness Scores:

$$r(\text{yellow}) = 1.0 \quad (6.2)$$

$$r(\text{yellow_green}) = 2.0 \quad (6.3)$$

$$r(\text{green}) = 3.0 \quad (6.4)$$

1125

Bruises Scores:

$$b(\text{bruised}) = 1.0 \quad (6.5)$$

$$b(\text{unbruised}) = 2.0 \quad (6.6)$$

1126

Size Scores:

$$s(\text{small}) = 1.0 \quad (6.7)$$

$$s(\text{medium}) = 2.0 \quad (6.8)$$

$$s(\text{large}) = 3.0 \quad (6.9)$$

1135 **Chapter 7**

1136 **CONCLUSIONS, RECOMMENDATIONS, AND**
1137 **FUTURE DIRECTIVES**

7.1 Concluding Remarks

In this Thesis, the prototype is successful in grading and sorting Carabao mangoes based on the user priority and machine learning algorithm. More specifically, the prototype is successful in automatically classifying Carabao mangoes based on ripeness (Green, Green Yellow, and Yellow), size (Large, Medium, Small), and bruises (bruised and not bruised)

7.2 Contributions

The contributions of each group member are as follows:

- BANAL Kenan A.: Scrum Master (Project manager in charge of the hardware and software integration)
- BAUTISTA Francis Robert Miguel F.: Front End Engineer (UI/UX Designer in charge of software interface and hardware assistant of the Scrum Master)
- HERMOSURA Don Humphrey L. : Back End Engineer (Software Engineer in charge of the machine learning algorithm and software assistant of the Scrum Master)
- SALAZAR Daniel G.: Product Engineer (Software Engineer in charge of training and testing of the machine learning algorithm)

7.3 Recommendations

The researchers recommend that the prototype be improved in the optimization of the machine learning algorithm and the hardware design. The researchers also recommend that

1157 the prototype be tested in the actual grading and sorting of Carabao mangoes in the market.

1158 **7.4 Future Prospects**

1159 Future researchers may consider the following recommendations for future work:

1160 1. User testing of the prototype in the actual grading and sorting of Carabao mangoes
1161 in the Philippine market.

1162 2. Additional of weight measurement to the prototype to improve the grading and
1163 sorting of Carabao mangoes.

1164 3. Integration of a custom PCB to improve the hardware design of the prototype.

7. Conclusions, Recommendations, and Future Directives

Appendix B ANSWERS TO QUESTIONS TO THIS THESIS

1170

1171

B1 How important is the problem to practice?

1172

1173

1174

A possible answer to this question is the summary of your Significance of the Study, and that portion of the Problem Statement where you describe the ideal scenario for your intended audience.

Etiam lobortis facilisis sem.

Panelist's Comments and Revisions	Action Taken	Page Number
Capture both two sides of the mango and not just one to remove error	The image capturing system would only capture the two sides of the mango which are the two largest surface areas of the skin.	18
How will you get large dataset with sweetness and how will you classify it?	Remove Sweetness in the SO	13
Size and weight are not the same.	Remove Weight in objectives but retained size in the SO4 and SO6	
Specify in the specific objectives that it will be automatic sorting	SO1: To make an image acquisition system with a conveyor belt for automatic sorting and grading mangoes.	13
Add what process will be used to get the size classification	SO6: To classify mango size by getting its length and width using OpenCV, geometry, and image processing techniques	13
Add what process the ripeness classification will be	SO5: To classify mango ripeness using kNN or nearest neighbors algorithm	13
Get rid of texture in the general objectives	Texture is removed in the SOs	13
Get rid of CNN in general objectives and replace with machine learning	CNN is removed and replaced with machine learning GO: To develop a user-priority-based grading and sorting system for Carabao mangoes, using machine learning to assess ripeness, size, and bruises.	13
Remove Raspberry Pi on the SO's and generalize to "to create a microcontroller based application"	SO3: To create a microcontroller application to operate and control the prototype.	13
Remove SO4. No need for user testing	Removed user test and the new SO4 is SO4: To grade mangoes based on user priorities for size, ripeness, and bruises.	13
Fix IPO to the correct input and output	Input: Two side image of the Carabao Mango and the User Priority Attributes Process: Machine Learning Algorithm, Grading Formula, and CNN model using a microcontroller Output: Size, Ripeness, and Bruises	20

C. Revisions to the Proposal

PRO1 Panel Comments and Revisions – Appendix Z

PRO1 Panel Comments and Revisions

Zoom Recording:

https://zoom.us/rec/share/mrn9zBtPz3bJ5laVcy2E8-iBno8A6fBRgOCacMrhmzLPCNO0IDxXBHiK_xzdicEb.MzbHGzrD7rL3tVgJ?startTim=e=1731326444000
 Passcode: +?qL6DZE

Summary:

- Specific Objectives
- Add:
 - what process will be used to get the sweetness classification
 - what process the ripeness classification will be
 - what process will be used to get the size classification
 - Specify in the specific objectives that it will be automatic sorting
- Remove:
 - get rid of texture in the general objectives
 - get rid of cnn in general objectives and replace with machine learning
 - remove Raspberry Pi on the SO's and generalize to “to create a microcontroller based application”
 - remove SO4. No need for user testing

Comments:

- *[00-00] time stamps from recording
 - [15:00] Why only the top side of the mango? Isn't the point of automation to reduce human error? Then what about the bottom side wouldn't that just introduce another error if the mango happens to have defects on the bottom?
 - [16:09] What is the load cell for? Size is not the same as weight. If size is taken from the weight wouldn't size be also taken from the image. If size then adding a load cell would just introduce more complexity, if weight then load cell is fine. reminder that size is not the same as weight.
 - [17:36] When computer vision, state input and output parameters. Output parameters in this case would be sweetness, ripeness, size and bruising. Input parameters would be images.
 - [18:12] No mention of how the dataset would be gathered. Would you be gather your own dataset or using a publicly available dataset
 - [21:38] Fix IPO based on mention input and output parameters.
 - [21:50] Dataset is lacking. Usually in machine learning at least 10,000 images. can take more than one image per mango. after taking an image of mango can make more out of the image using data augmentations.
 - [22:48] Add to specific Objectives the mentioned 80%
 - [23:09] Consultant that would grade the mangoes as a third party to remove biases. For both the testing and the training
 - [24:55] How do you detect the sweetness of mangoes? Add these to the specific objectives. What are the categories of sweetness? Add these to specific objectives. How do

1407

PRO1 Panel Comments and Revisions – Appendix Z

you detect the correct categorization of sweetness? How to automate the classification of the sweetness.

- [33:10] Why is the dataset destructive but the testing non destructive? Clarify this further to avoid confusion.
- [35:09] What is the basis of sweetness using images? Clarify this further.
- [35:35] How would you know if the classifier is correct or not? What is your ground truth (for the sweetness)?
- [38:55] When can you say you are getting the top side of the mango? How would you know if the mango images showing the top side or the bottom side of both cheeks of the mango can be captured? If it doesn't matter then any side can be captured so why is it in the limitations that only the top side can be captured. Clarify the limitations.
- [48:10] What classifier would you use here? What features would you extract from the images?
- [52:07] Does it explain what process will be used to get the sweetness classification? Add it to the specific objectives
- [54:00] How will ripeness be classified? Will it use the same dataset as the sweetness classification did? How was ground truth obtained?
- [55:44] Why not the nearest neighbor? It is more fit in this scenario. Do not specify CNN in the objectives. The embedded systems as well, do not specify the Raspberry pi unless truly sure
- [57:30] Table is just image processing. Is there a specific objective that would describe how ripeness classification will be done? Add this to the specific objectives.
- [59:10] How is the weight obtained? Add it to the specific objectives. Remember that size is not proportional to weight. Size could be obtained from the image as the camera is from a fixed distance. Add to specific objectives how to get the size
- [1:00:00] get rid of texture in the general objectives. get rid of cnn in general objectives and replace with machine learning. as each parameter will use a different method.
- [1:04:00] remove Raspberry Pi on the SO's and generalize to "to create a microcontroller based application"
- [1:04:37] remove SO4. no more user testing
- [1:05:00] The formula used for grading the mangoes, is this used as industry standard? How do they measure the export quality of mango
- [1:07:00] Specify in the specific objectives that it will be automatic sorting

Here are my comments on my end :)

1. Ensure seamless integration between hardware (sensors, motors, etc.) and software (CNNs, Raspberry Pi). You can consider using a modular approach for easier troubleshooting.
2. How do you gather a comprehensive and diverse dataset for training your CNN. This will enhance the model's robustness and accuracy.
3. Make sure that the weight sensors are calibrated correctly to avoid measurement errors.

C. Revisions to the Proposal

De La Salle University

1408

PRO1 Panel Comments and Revisions – Appendix Z

4. Implement data augmentation techniques to enhance your image dataset, which can improve model generalization and accuracy.
5. Design an intuitive user interface for the Raspberry Pi application.
6. Besides precision, recall, and F1 score, consider incorporating confusion matrices to better understand model performance and error types.
7. Conduct user testing of the application to gather feedback on usability and functionality. This can lead to improvements in design and user experience. Consider how the system can be scaled or adapted for different fruits or larger processing volumes in the future.
